4 National University of Sciences and Technology Rawalpindi, Pakistan
5 University of South Florida, USA

Job Monitoring service provides real time job monitoring and status feedback to steering service while operating in close interaction with execution service in order to provide interactivity, fault tolerance and traceability in an Interactive Grid Analysis Environment.
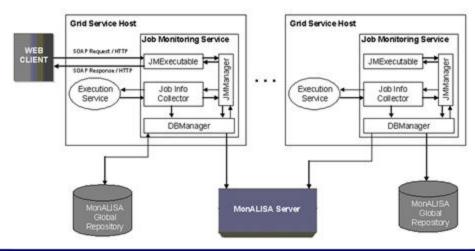

Features

1) Provides easy to use API for getting monitoring information of viatal job attributes that can play important role in increasing performance and rescheduling of job.

2) Publises all the monitoring information to MonALISA servers running at different sites.
