# Modeling

Practice

# Internet Architecture (in 84)

Requirements

- Functionality
- Robustness / Survivability
- Scalability
- Predictability
- Performance Guarantees

Architecture

1. Centralization
2. Network Intelligence
3. Network Components
4. States
5. Addressing
6. Traffic prioritization
7. Security Boundaries

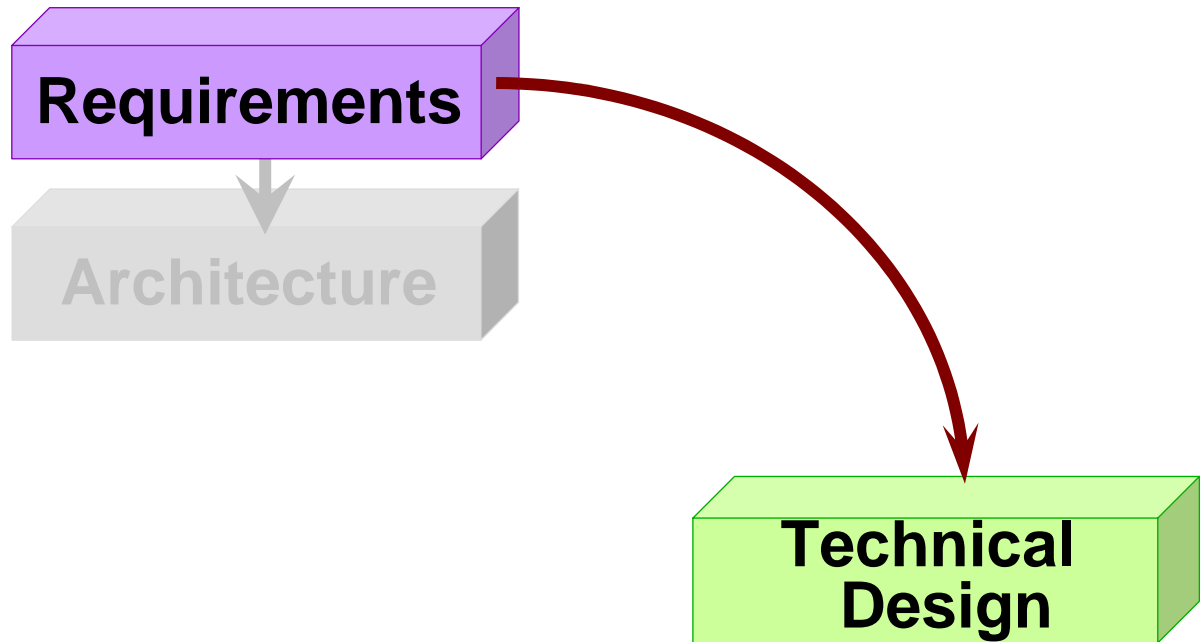

- **One-to-one, bidirectional**
- **Maximum**
- **Good**
- **Fair**
- **None**

1. **Zero**
2. **Minimum** (E2E argument)
3. **Nodes and Hosts**
4. **Stateless**
5. **Fixed size, numerical**
6. **None**
7. **Within end-systems**

## Transport Level

# Layering principle

Graphical Presentation from Norway, 1976

Predating OSI

# Topological Representations

**The idea that**

**Networks have only two major  
components**

**Hosts and Nodes**

**turned out to be**

**Architecturally Dangerous**

Sandwiches

# The Danger of the Host/Node Divide

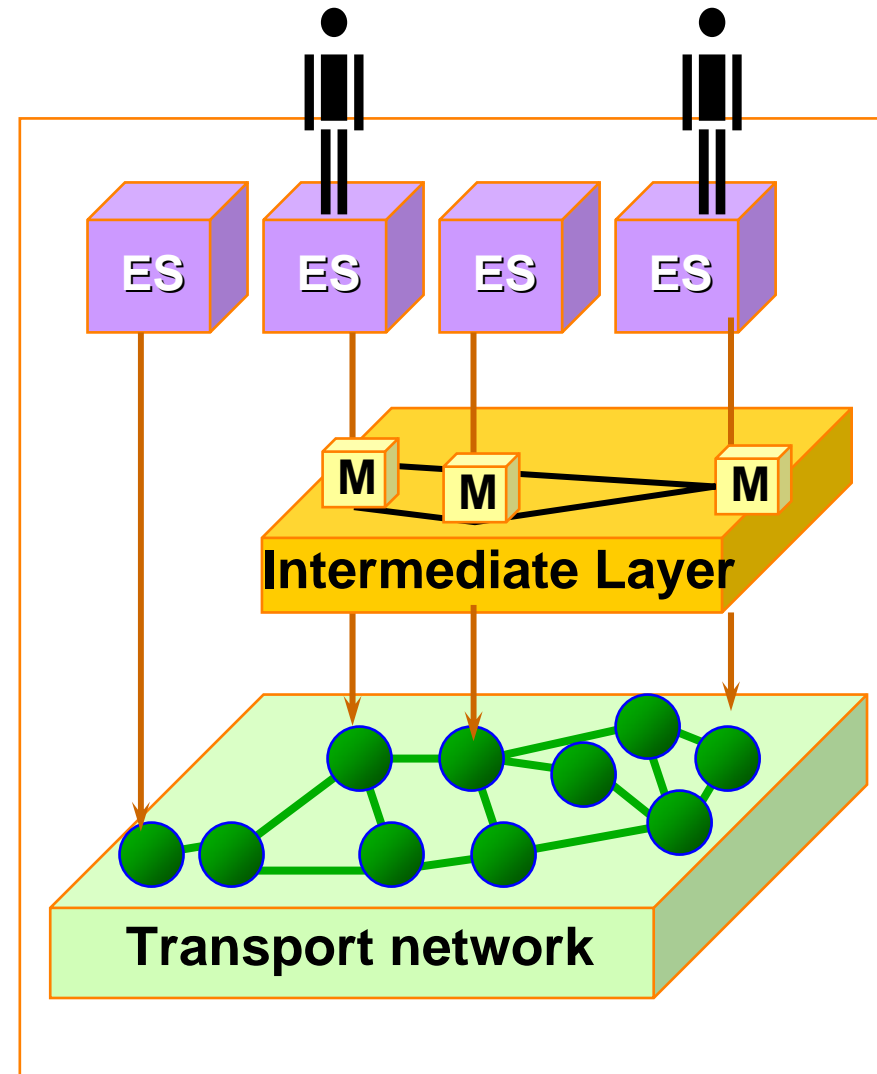

- Neglect the role of **Intermediate Layers**

# What is Intermediate Layer?

A set of **intermediary** systems

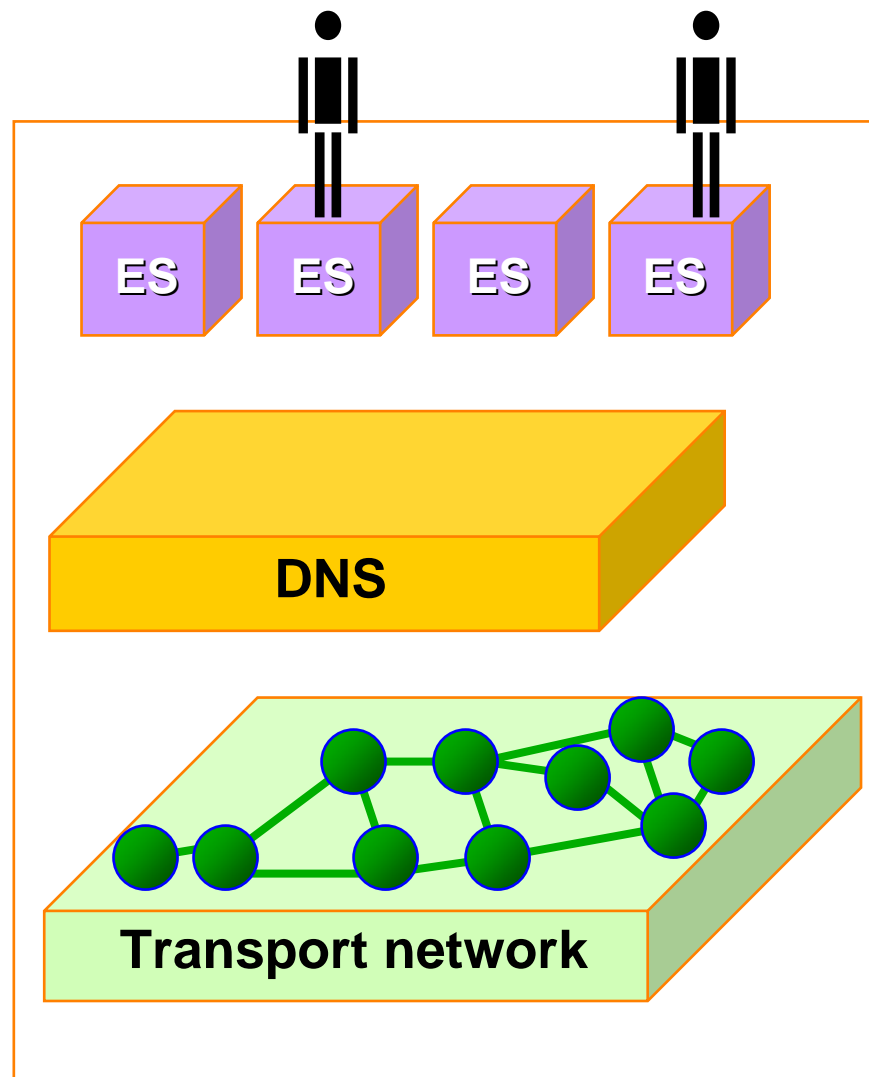

- **invisible** to the **end-user**
- **on-top** of the base transport network
- which all **conspire** to deliver a specific service
- forming a **topology**
- essential but ...  
**not compulsory**

# Intermediate Success Story?

## Only one Intermediate Layer

- Universal
- Invisible
- Well managed
- Unchallenged

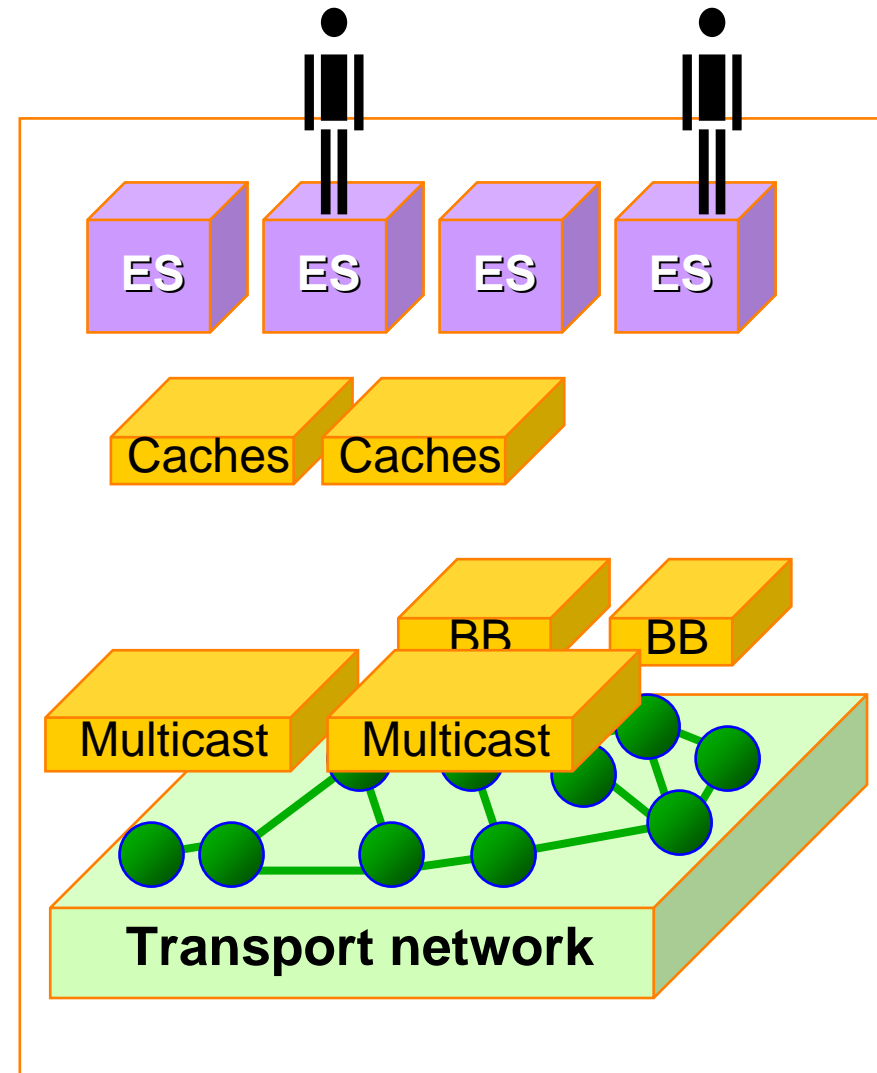

# Intermediate Layer “Disappointments”?

## Because

- Non-Universal
- Fragmented
- Non-open (proprietary)
- Difficult to manage

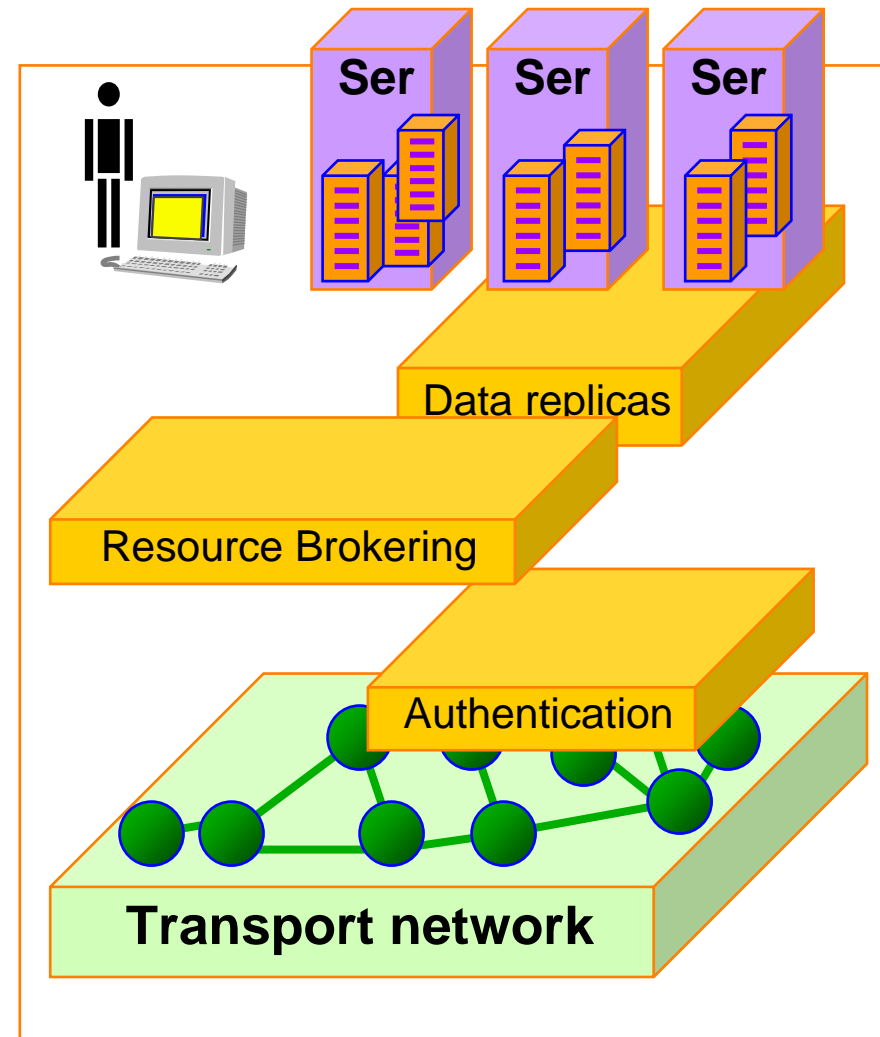

- **IP multicast**
- **Web caches**
- **Bandwidth Brokers**
- ...
- **PKIs**

# Grid Middleware Layers?

## Issues

- **Topology Management**
  - Configuration
  - Changes
  - Optimization
  - Monitoring
- **Inter-domain Operation**

## DNS apart, Intermediate Layers

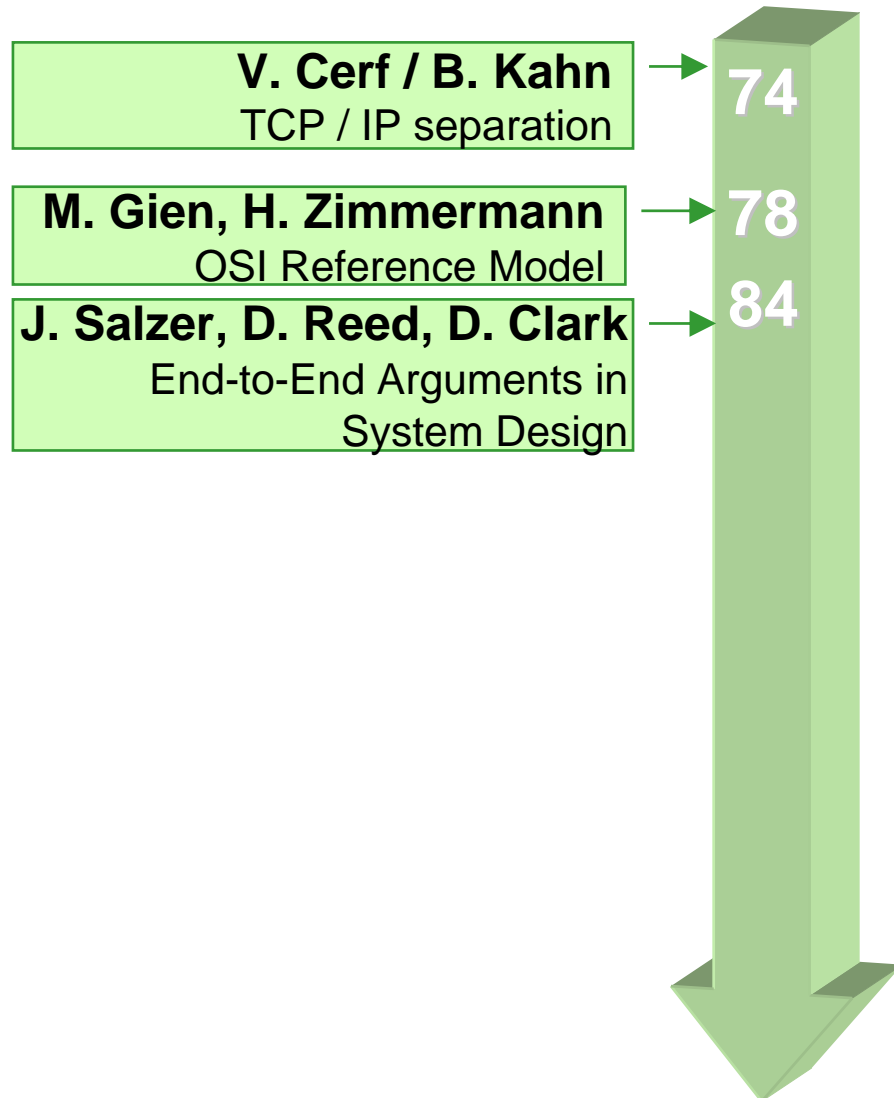

- failed to establish **universal services**
- are often **poorly managed**

Dumb

# The Internet End-to-end Argument

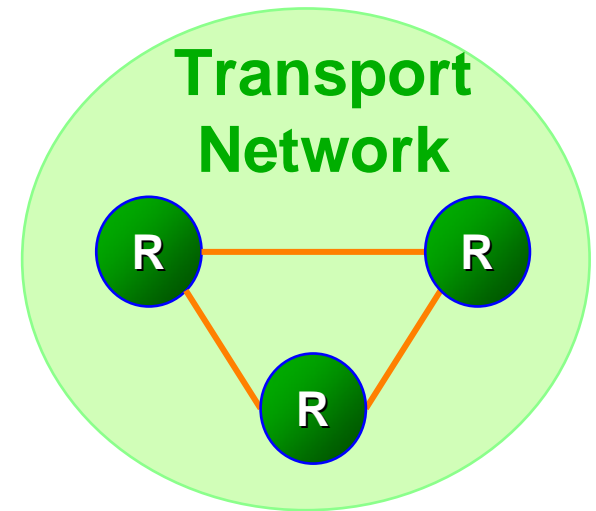

## Transport Level

# The Internet End-to-end Argument

## “Intelligent” Hosts - “Dumb” Network

- **No Flow Control / No Buffering**
- **No Error Recovery**
- **Security** in End-systems
- **Addresses** carried unchanged

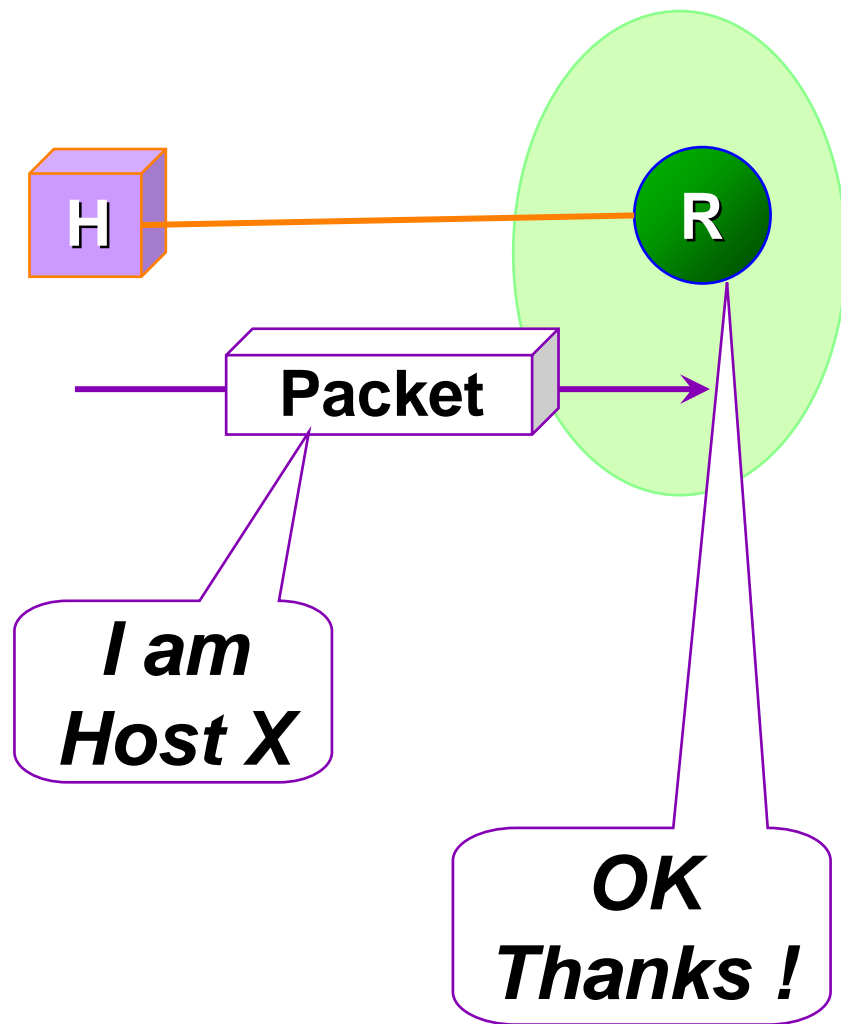

# Addresses Carried unchanged

## One consequence

1. **ES** set themselves their source address

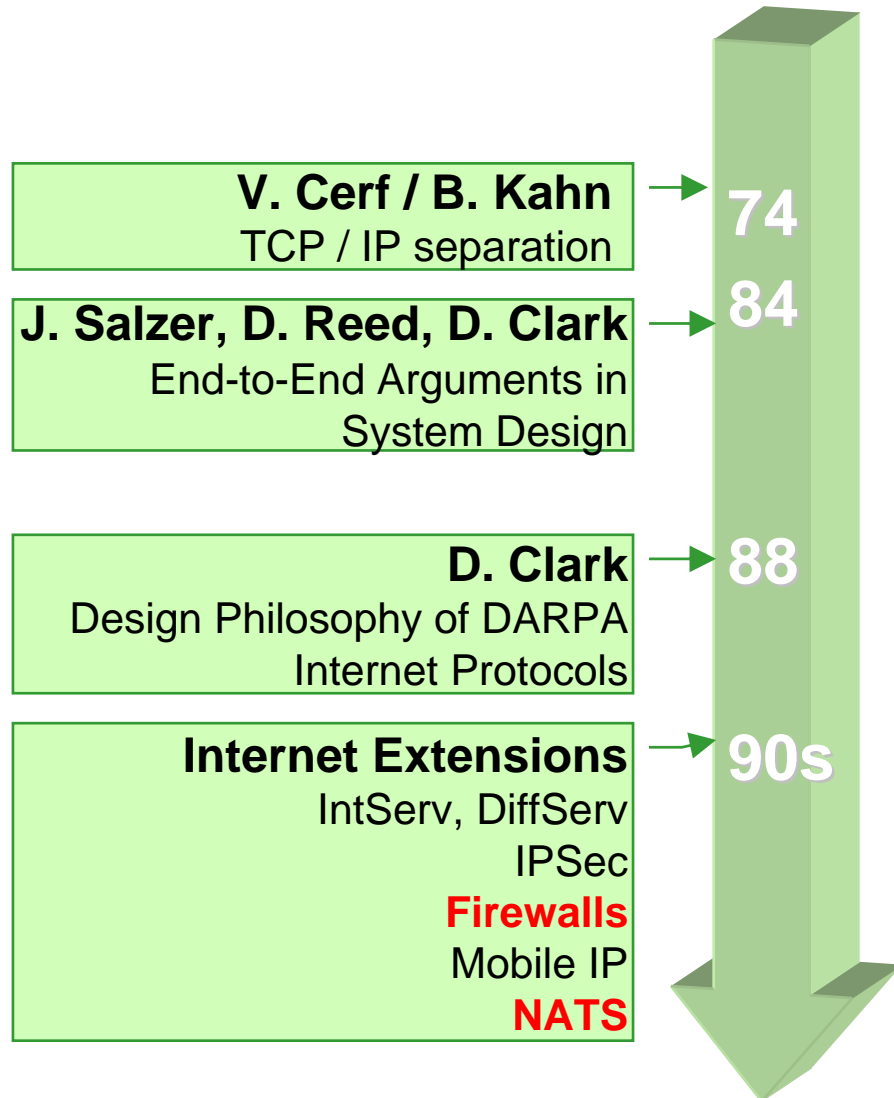

unlike e.g. brave old X.25

2. **IPSec** was needed

# Internet Architecture Extensions

## Transport Level

# Some “Good” and “Bad” Extensions

## Pose Serious Architectural Difficulties

- 1. NATs**
- 2. Firewalls**
- 3. Web Caches**  
e.g. when attaching ads

## No Serious Architectural Difficulties

- 1. IPSec**
- 2. MPLS**
- 3. QoS**  
Diffserv, Intserv

# Role of States

# IP is stateless

---

- **Stateless (Connectionless)**
  - packets may be lost, miss-ordered
  
- **Stateful (Connection-oriented)**
  - no data sent before authorized by network (by means of call set up)

**Internet (IP)**  
**Web (HTTP)**  
**=**  
**Stateless**

# IP, HTTP Stateless Regular Behavior

---

- **IP switch**

- take a packet, forward it, forget it ...
- take a packet, forward it, forget it ...

- **HTTP server**

- take a request, serve it, forget it
- take a request, serve it, forget it

*Predicting Load?*

**When you have  
no memory of the past,  
you cannot  
predict the future**

# Efficiency or Perfectionism

# Types of Applications

---

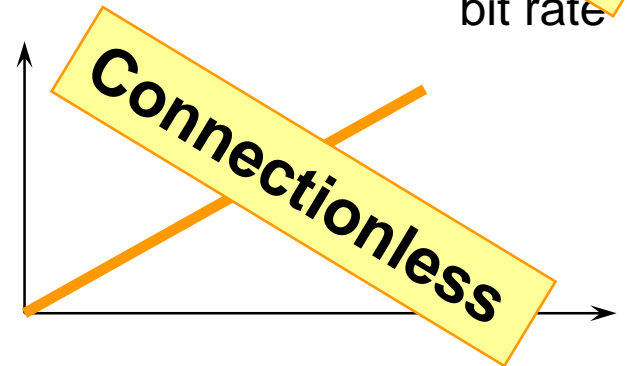

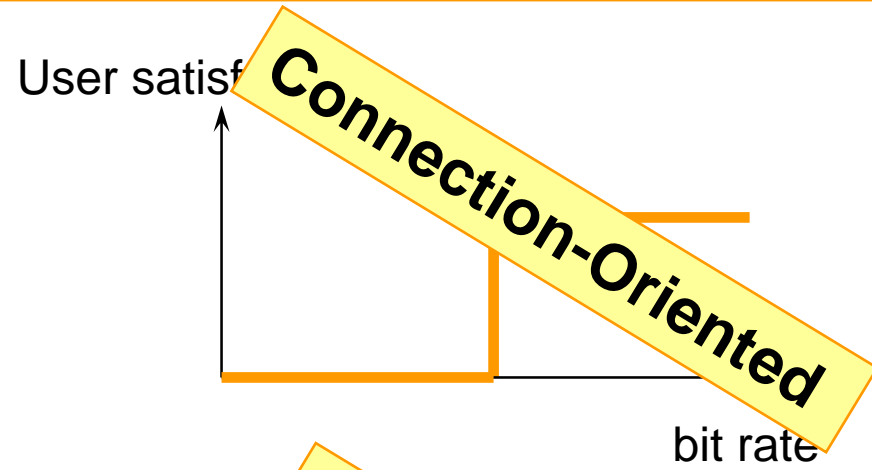

- ***Constant Bit Rate (CBR)***
  - e.g. PABXs
- ***Available Bit Rate (ABR)***
  - e.g. file transfer
- ***Variable Bit Rate (VBR)***
  - e.g. compressed audio, video

# Quality of Service and bit rate

- **CBR applications**

- **ABR applications**

- **VBR applications**

From Scott Shenker,  
Fundamental Design Issues for the Future Internet

# Fact of Life: Effort and Result

- Any human undertaking

- **VBR** applications

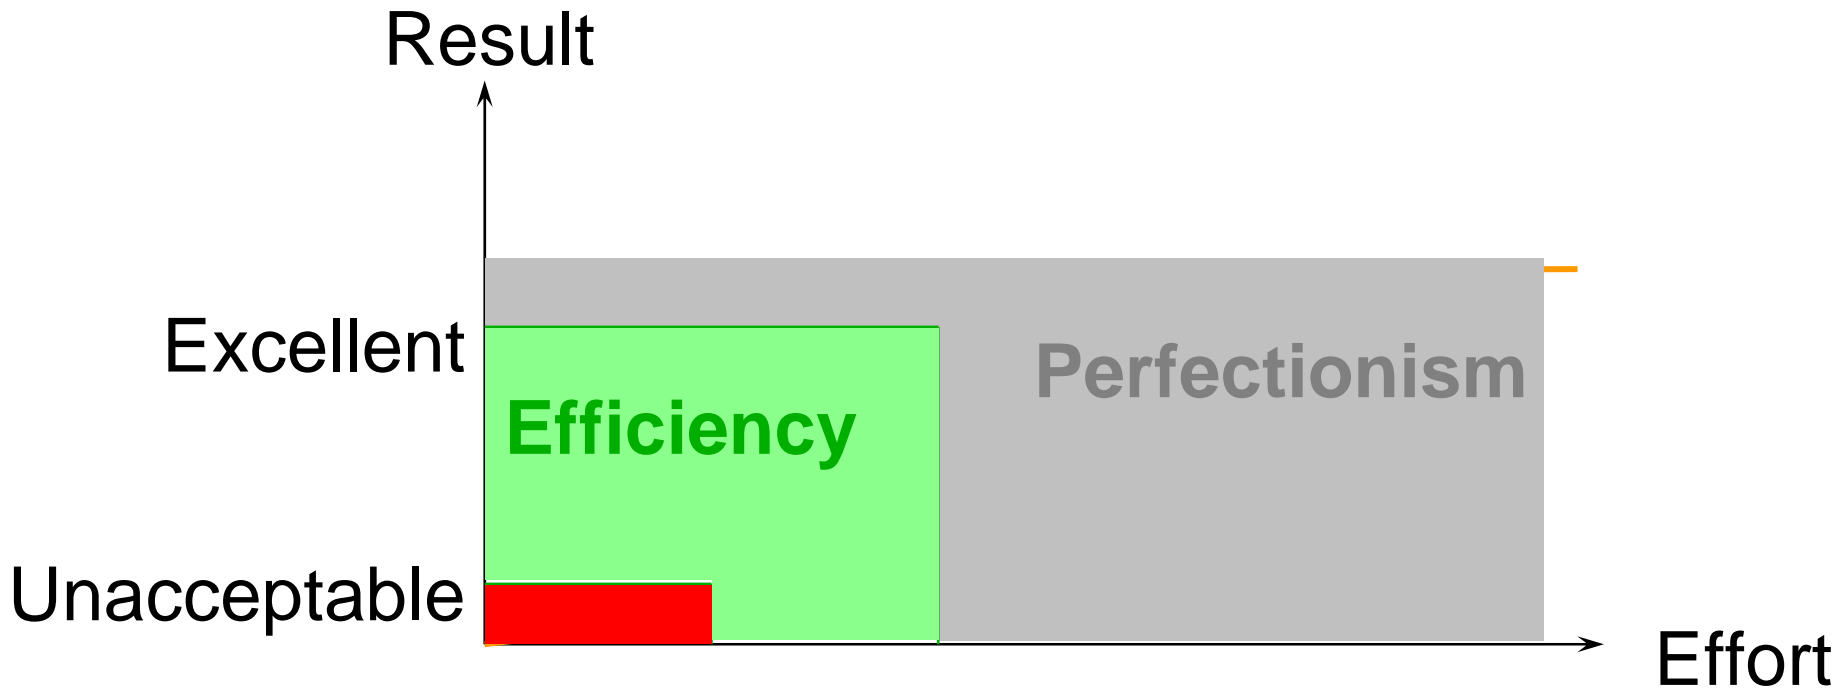

# Fact of Life: Effort and Result

bit rate

# Efficiency or Perfectionism

- **Stateful Networks are good at CBR, bad at ABR**
- **Stateless Networks are good at ABR and VBR, bad at CBR**

# Lories and TGV

- **Stateless systems**  
(no reservations)  
**scale well**, but are **bad** at **QoS**

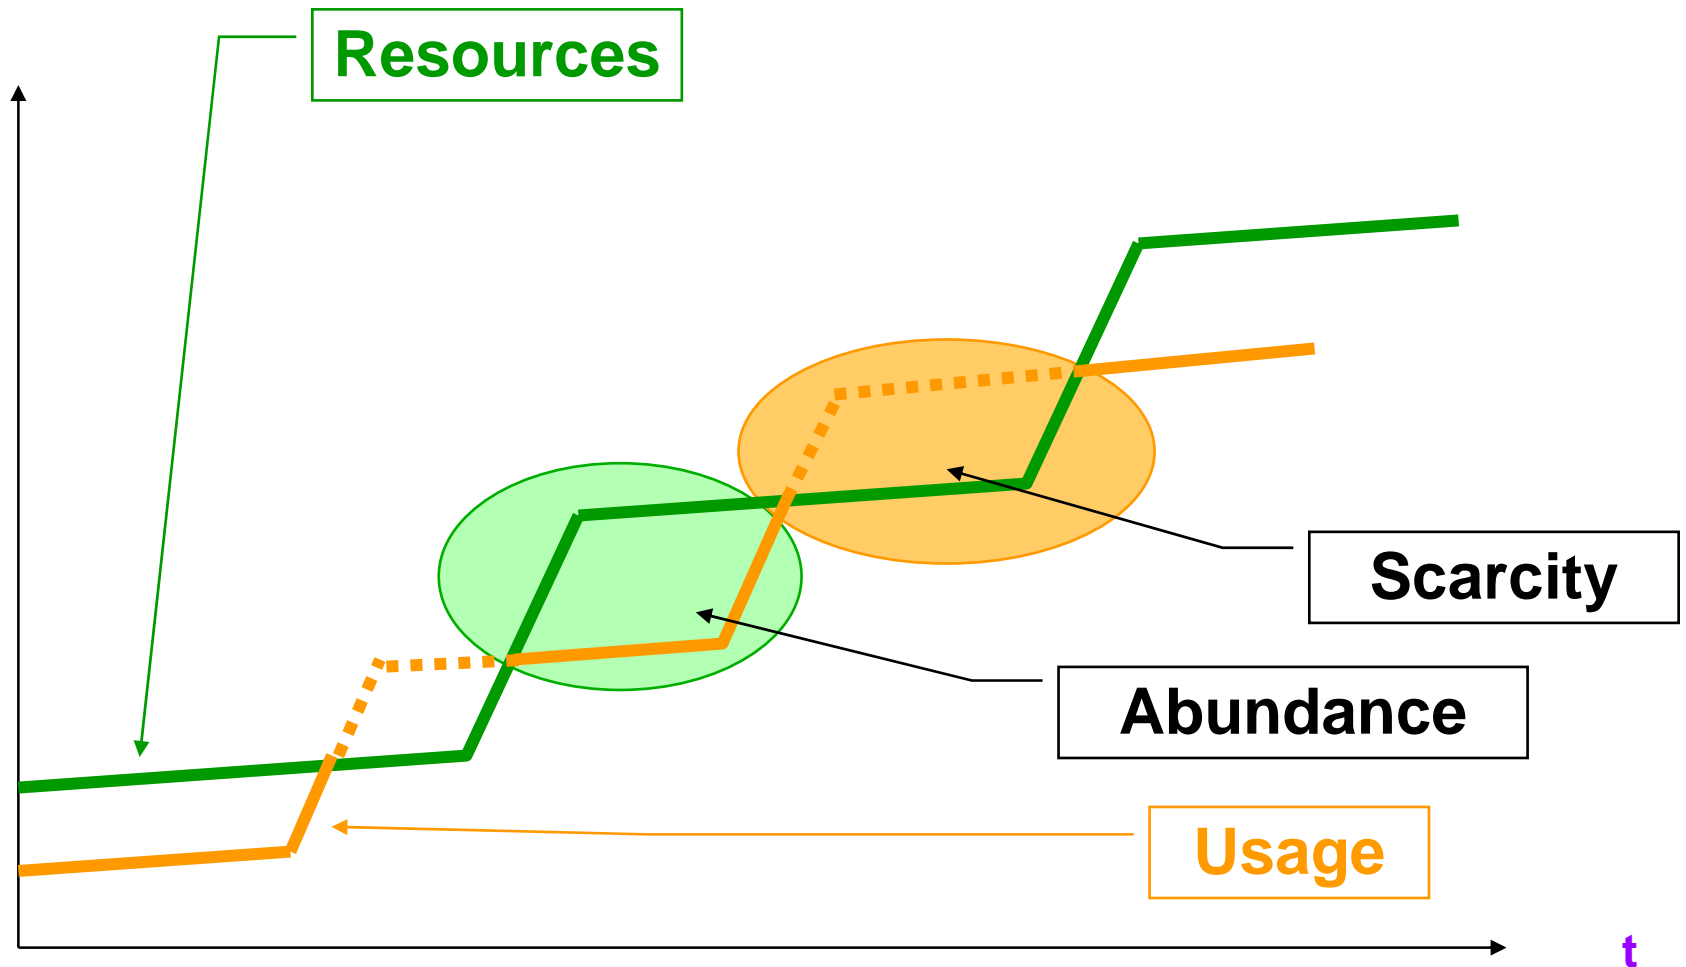

- Stateless systems  
(no reservations)  
**scale well**, but are **bad at QoS**
- Stateful Systems  
(reservations)  
are **good at QoS**, but **bad at scaling**

# Abundance and Scarcity

# Resources and Usage

# Observations

---

- **Core ISPs**

- Capacity utilized at 12%

- **LANs**

- Over-provisioned

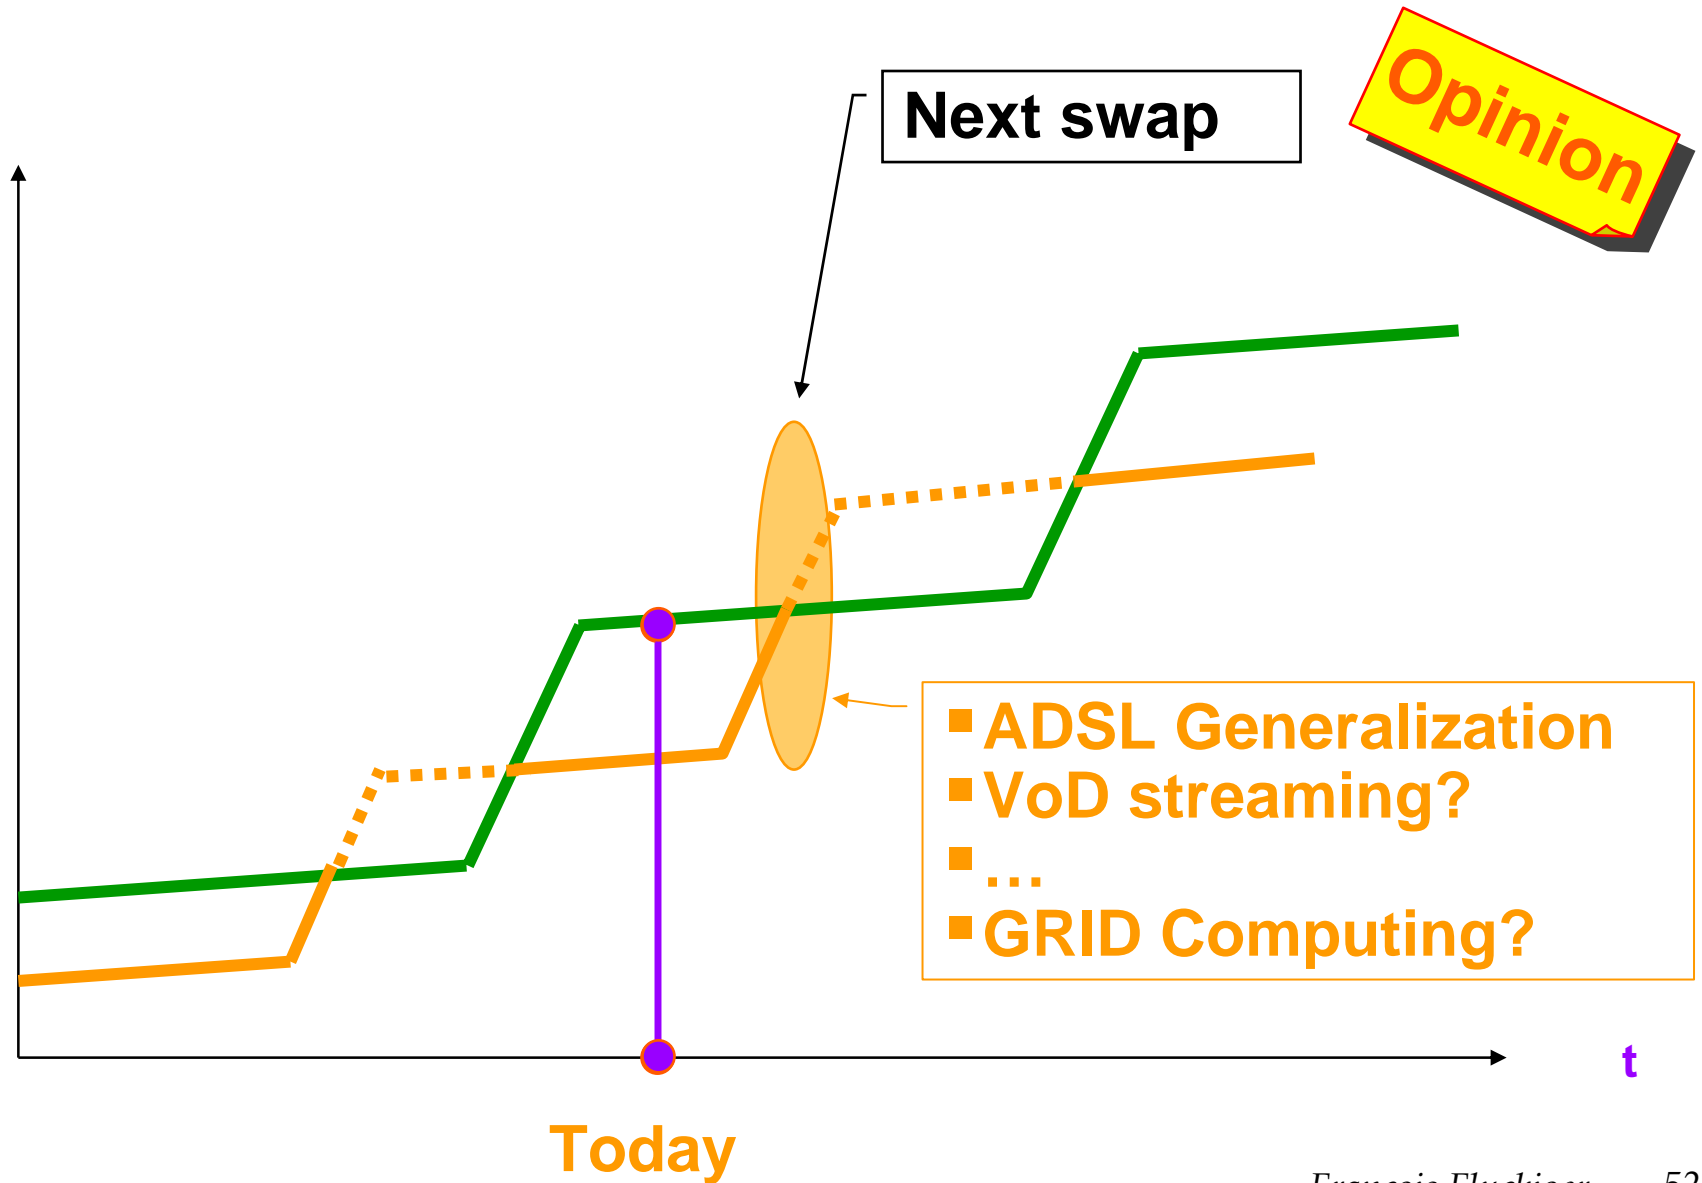

- **Real problems**

- Corporate **WANS** (ISP Managed Networks)
- Networks with **Radio** sections
- Wireless **Internet Telephony**

# Resources and usage

# Resources and usage

***“Migration?”***

***The things I know that migrate are***

***birds***

*“Let’s speak about **transition**”*

# Transition

- **Past attempts of smooth transition:**
  - **Xxx -> OSI**
  - **DECNet 4 -> DECNet 5**

# Flag-Day

- **DARPA / Internet**

- **French Telephone Numbering**

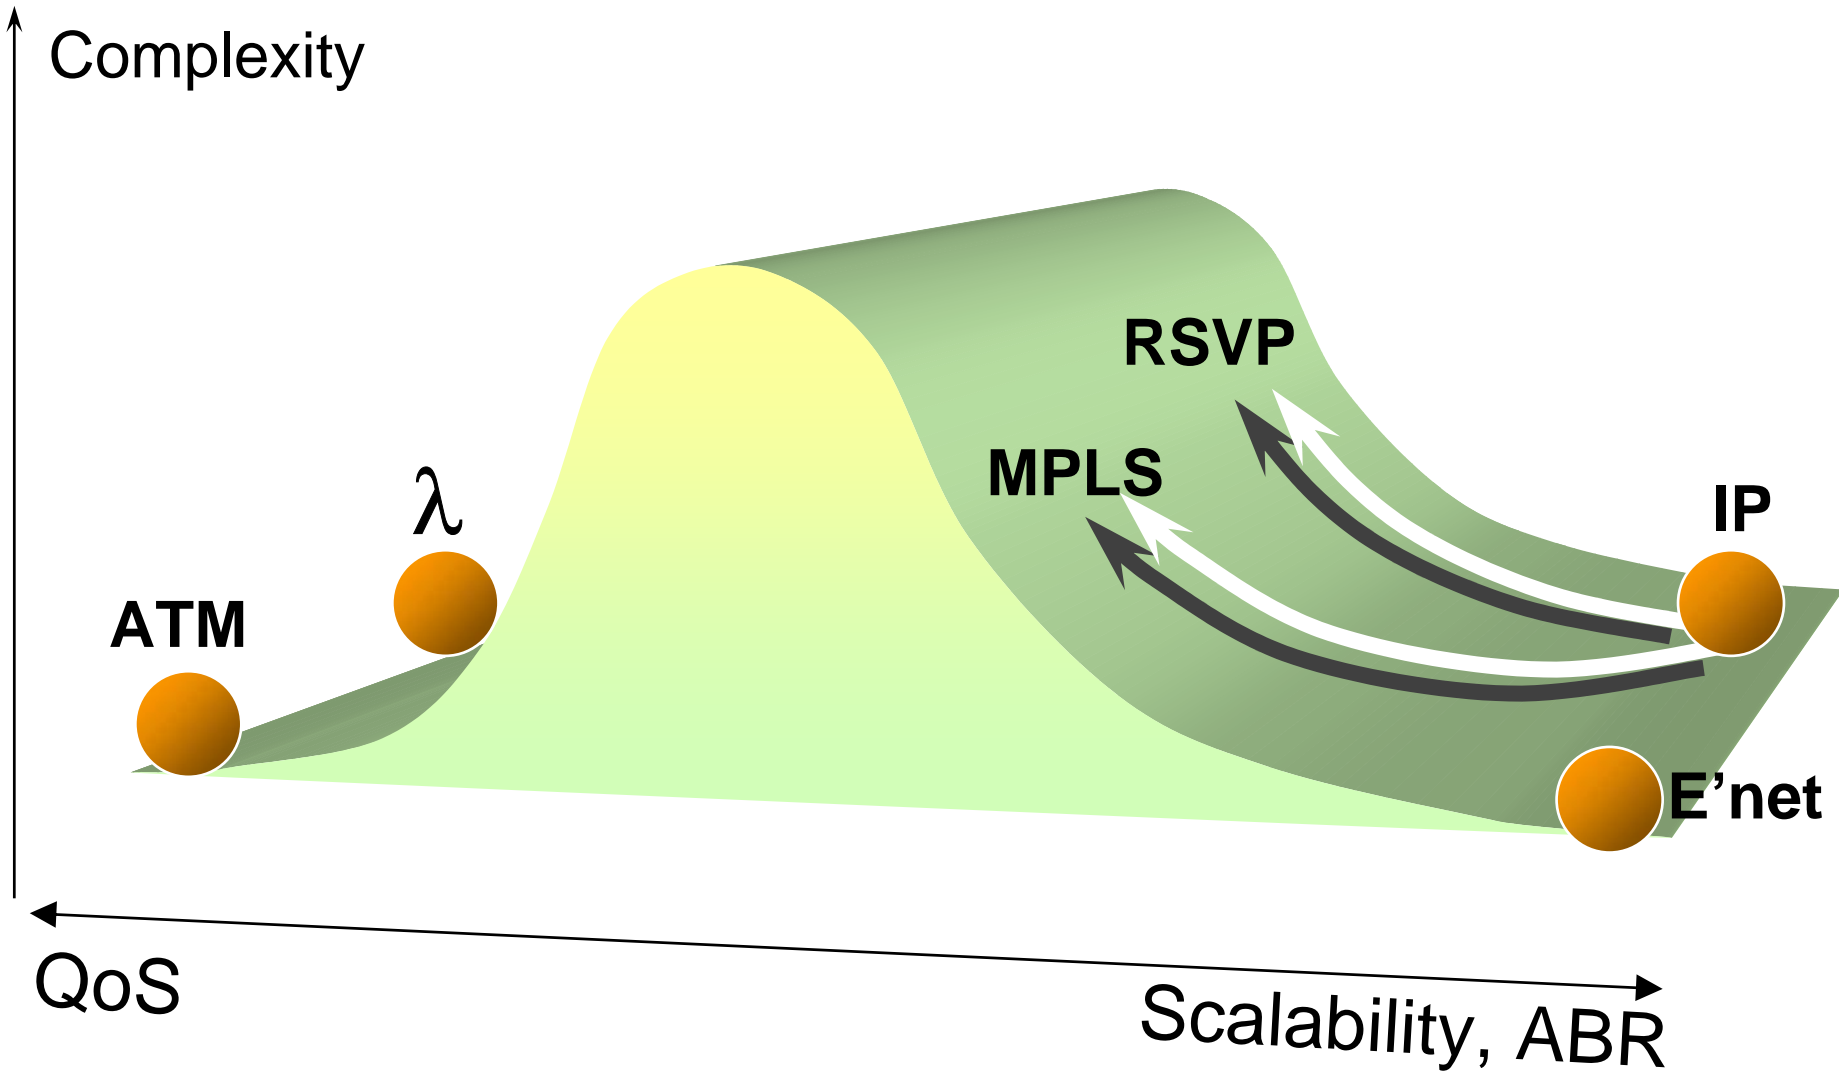

# IPv6 Transition

- **Flag-day** no longer an option
- v6 transition is **complex, costly**
- Some specialists now talking of **Co-existence** instead of **transition**

- **Most smooth transitions in Networking have failed so far**
- **Transitions may lead to endless co-existence**

# Overview of HEP Wide Area Networking

F. Fluckiger

## OVERVIEW OF HEP WIDE AREA NETWORKING: PRODUCER PERSPECTIVE

Report No. CERN-DD/89/20

European Laboratory for Particle Physics  
CH-1211 Geneva 23, Switzerland

Francois FLUCKIGER<sup>1)</sup>

Geneva, 26 May 1989

The purpose of this report is to provide an overview of the HEP wide area networking situation as it stands at the end of 1988. It is intended to be a starting point for discussion and to provide a common background for the various groups involved in the development of HEP wide area networking. The report is organized as follows: Section 1 describes the current situation, Section 2 discusses the various groups involved in the development of HEP wide area networking, and Section 3 discusses the future prospects.

### INTRODUCTION

The purpose of this report is to provide an overview of the HEP wide area networking situation as it stands at the end of 1988.

Submitted to CHEP89: Computing in High Energy Physics 89

University of Oxford, England, April 10 - 14 1989

CERN-DD/89/20

# The Worst Possible Network

EE → BC, DM, DW

From R. Rount, RARE Conf, Leu Buller's, May 88

## What do Users Want?

- Network infrastructure priced realistically.
- General Purpose, high connectivity, network.
  - High total bandwidth,
  - Moderate bandwidth per user,
  - Management, directories, nameservers, etc., etc.
- 'Mission-Oriented' networks where appropriate.
- Access to fibres (or G703) for special applications.

  - Management, directories, nameservers, etc., etc.
- 'Mission-Oriented' networks where appropriate.
- Access to fibres (or G703) for special applications.

DNS apart, No **universal**,  
Easy to Manage **Overlay**  
Layers

Services more Fragmented  
in future

Success Story

**HTTP** and **IP**  
Same stateless philosophy

Application / Network  
compatibility:  
Key for successes of the  
future

**Switched** Circuits in **Core**  
never worked satisfactorily  
to support a IP

Skepticism for  
**switched**  $\lambda$   
in Core Internet

Conceptual antagonism  
between **QoS** and  
**Scalability / ABR**

Future is in  
**Stateless** Technology  
with some **stateful stuff...**  
rather than the reverse

Oscillating Mismatch  
between  
**bandwidth offer / demand**

Next phase of **scarcity**  
will come

Smooth transitions in  
Networking have failed so  
far

Hard time for **IPv6**
