

# Simple and flexible drive and tape daemon configuration

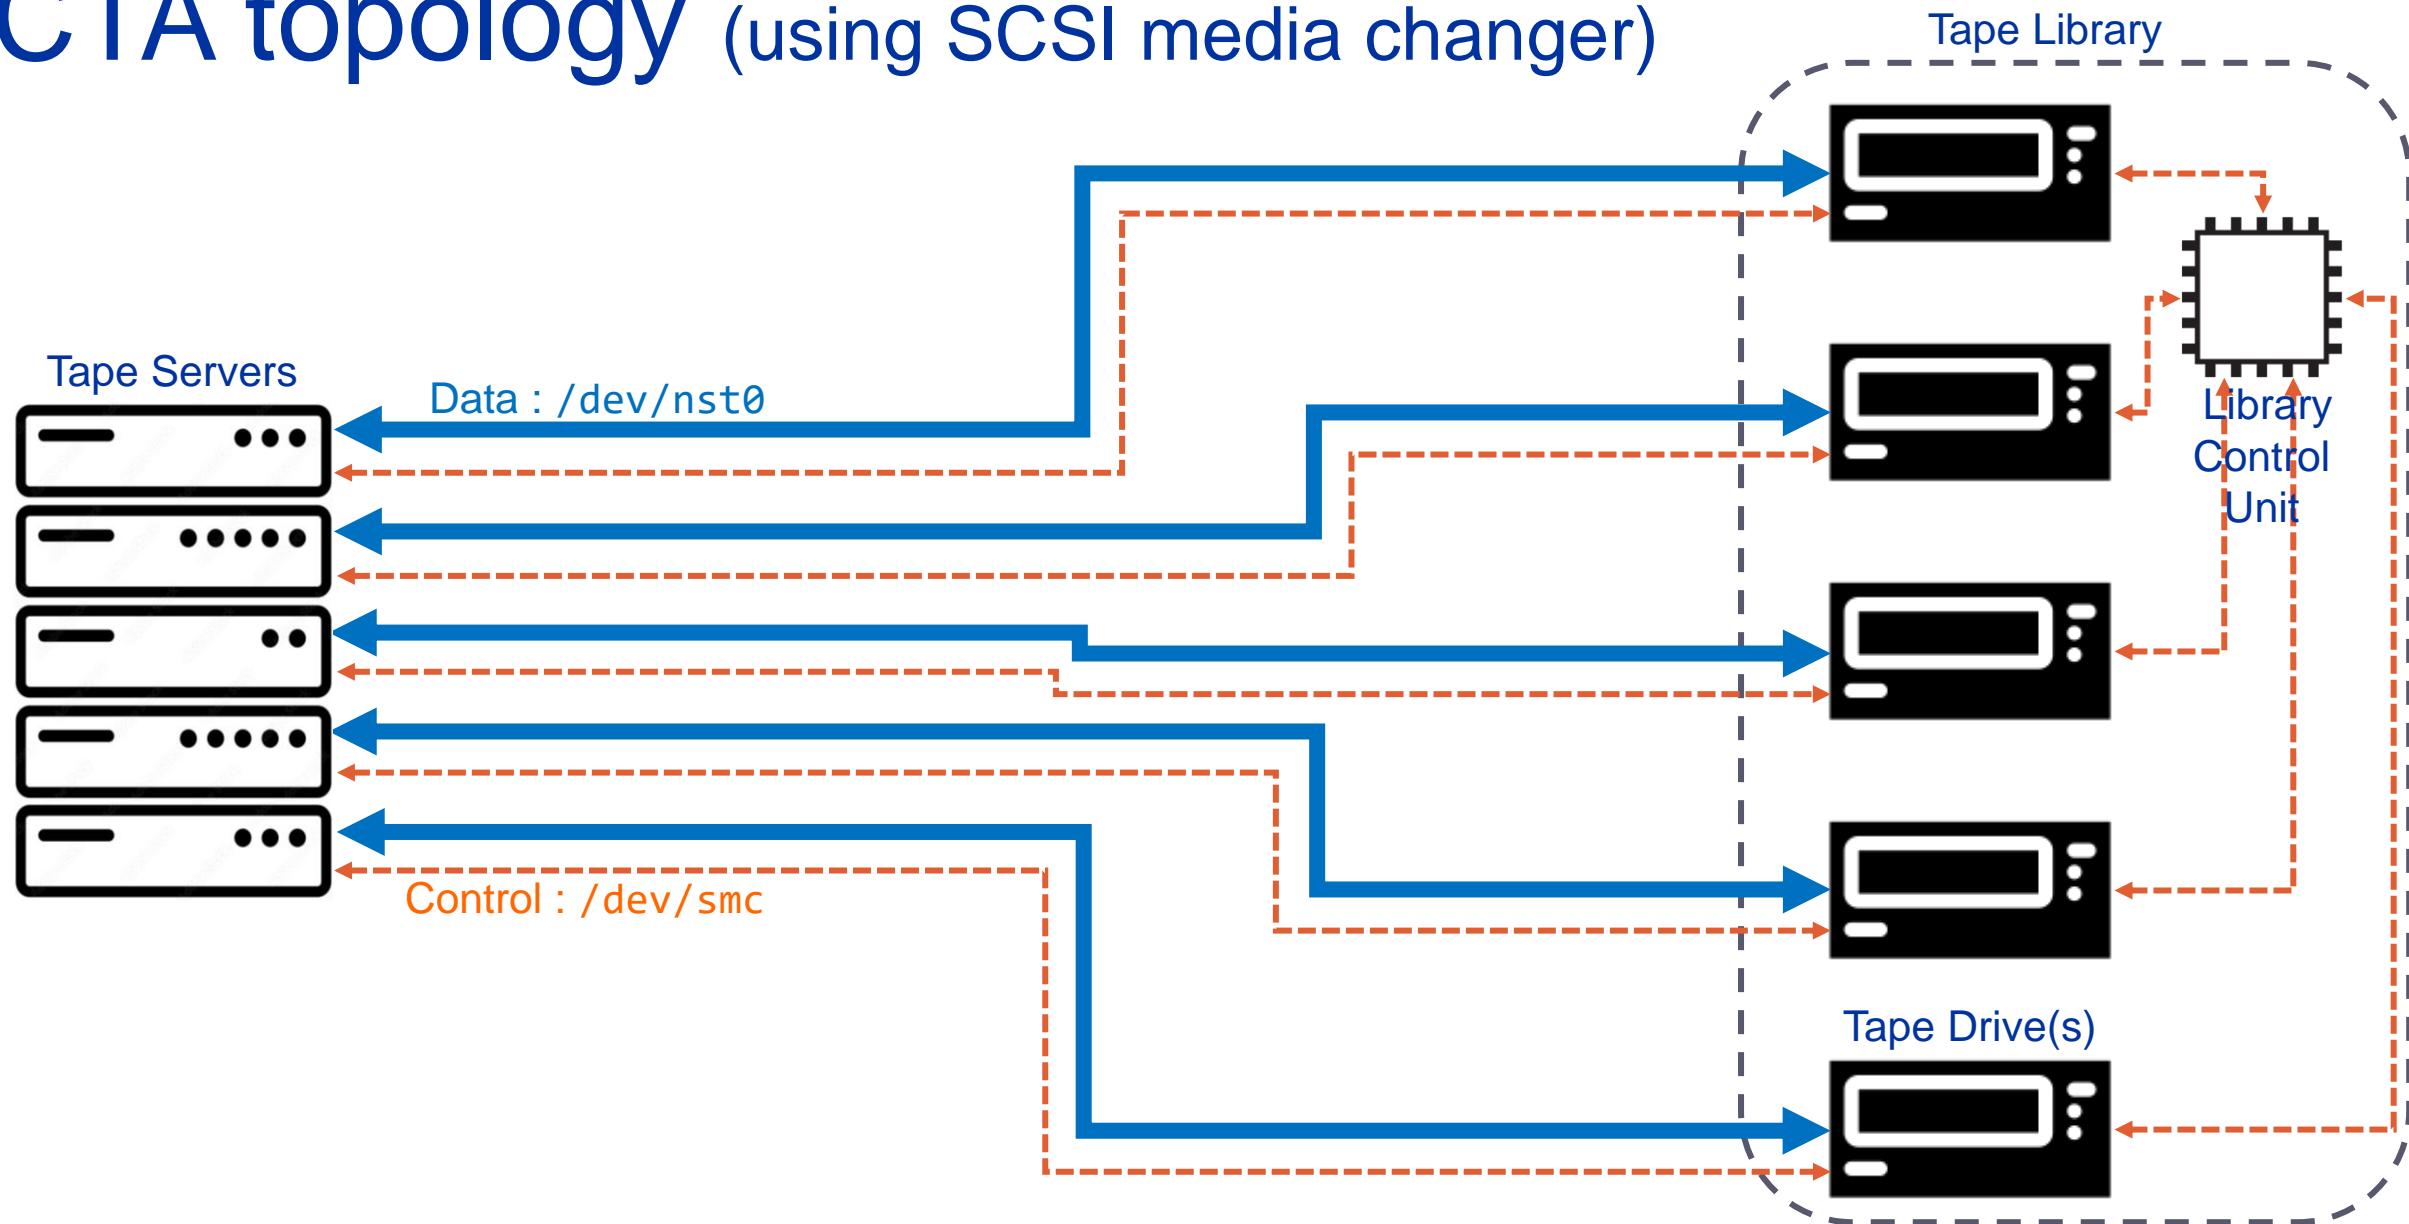

Vladimír Bahyl  
Pablo Oliver Cortés  
IT-SD-TAB

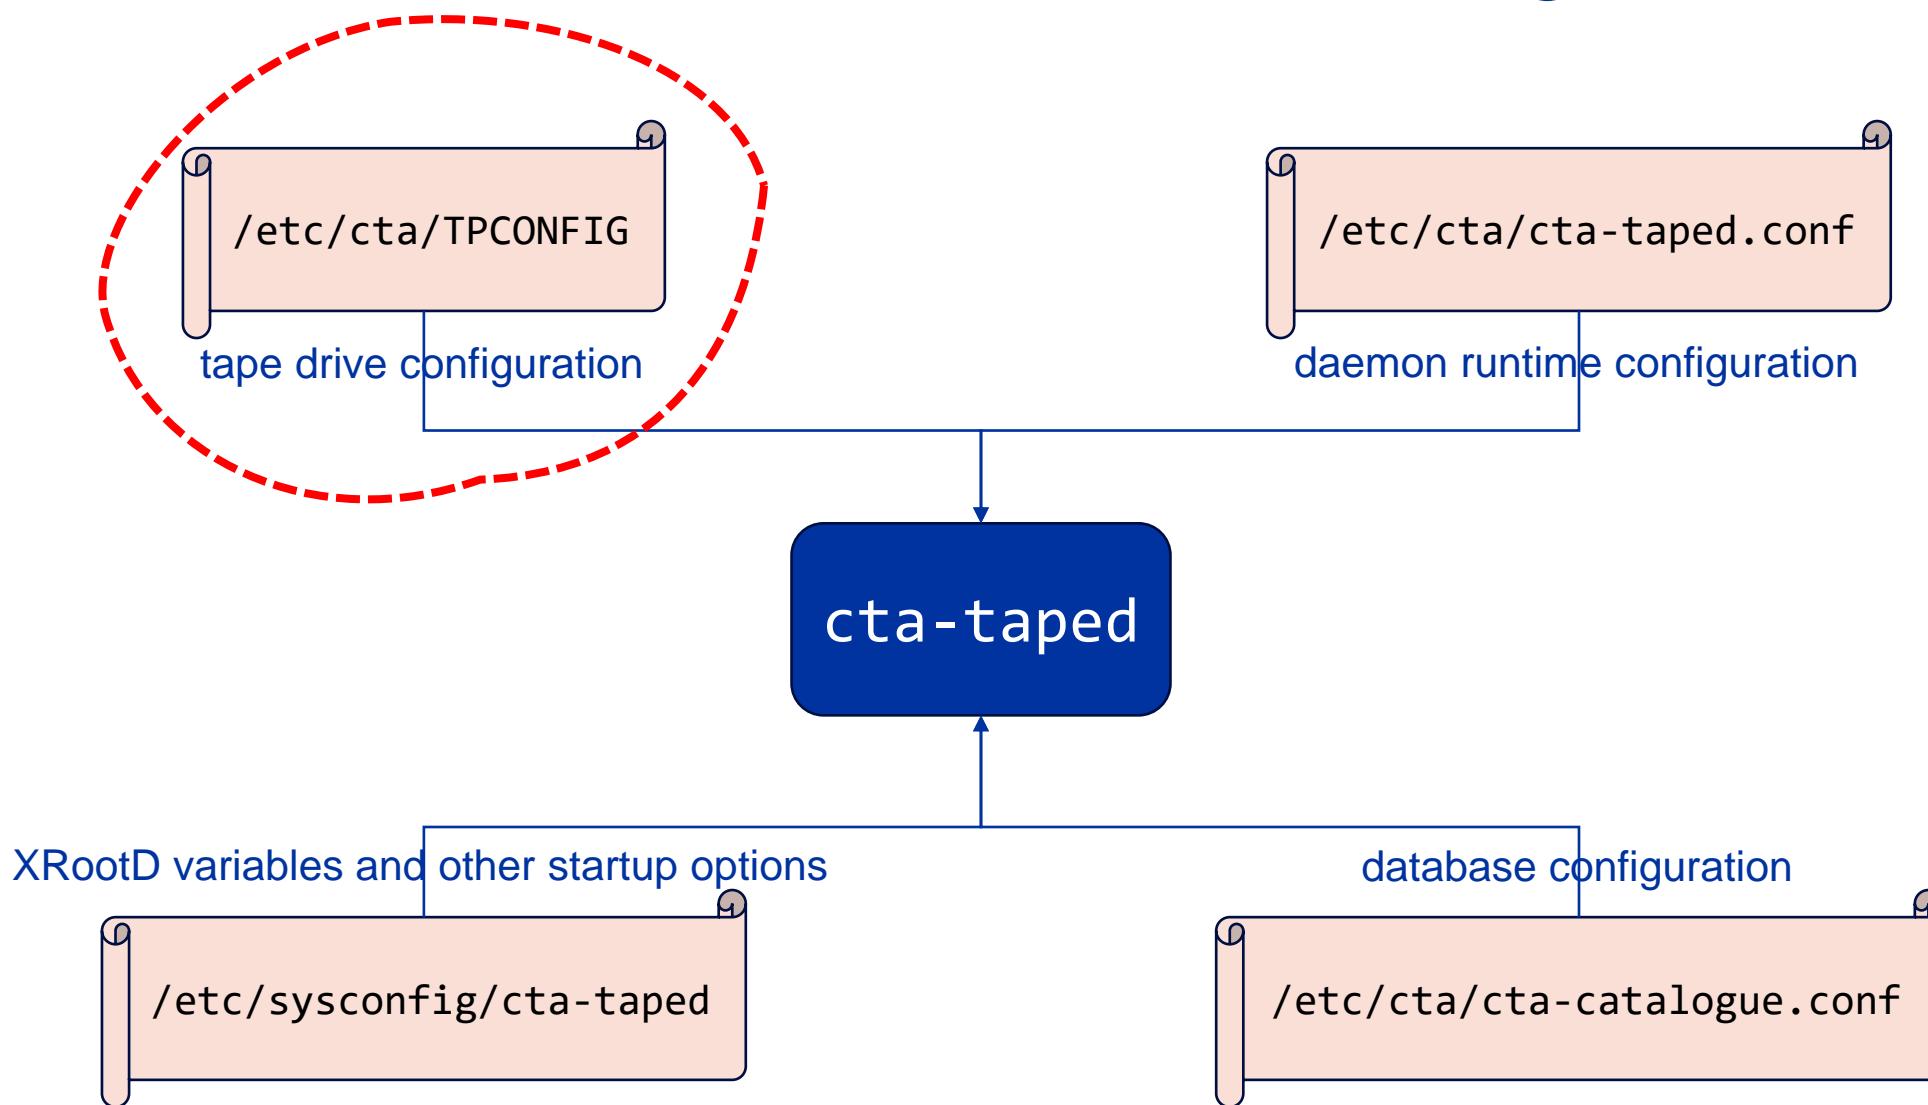

# Classic tape storage topology

# CTA topology (using SCSI media changer)

# Current structure of cta-taped configuration files

# /etc/cta/TPCONFIG particularities

- Legacy configuration file from CASTOR (CERN's predecessor of CTA)
  - At CERN it relies on manually entered configuration stored in unmaintained obsolete database
- Used by the cta-taped daemon to communicate with tape drive devices to archive and retrieve data
- The content depends on site specific details / naming conventions such as:
  - Tape libraries (logical & physical)
  - Tape drives (types)
  - Tape servers
  - Connection topology between these components

```
[root@tpsrv015 ~]# cat /etc/cta/TPCONFIG
#####
#
# CTA Tape Server Configuration file
#
# tape           logical        system          library
# drive          library         device          control
# name           smc27
I4550834      IBM455       /dev/nst0

#####
#
```

Most important field linking the drive (device) with the (position in the) library

# Objective: Generate the configuration automatically

- Extract the maximum information directly from the tape drive (connected to a tape server) and use it to generate cta-taped drive configuration file
  - Problem: tape drives are independent (= they do not know about each other), only the library knows who is where (= which tape drive is defined in which library partition)
- Tape library serial number
  - Use SCSI media changer device

```
[root@tpsrv300 ~]# /usr/bin/sg_inq ` /usr/bin/lsscsi -g | /usr/bin/grep ' mediumx ' | /usr/bin/awk '{print $7}'`  
| /usr/bin/grep 'Unit serial number:'  
Unit serial number: 0000078AA6480401
```
- Tape drive type and serial number
  - Use SCSI generic (sg) device driver information

```
[root@tpsrv300 ~]# /usr/bin/sg_inq ` /usr/bin/lsscsi -g | /usr/bin/grep ' tape ' | /usr/bin/awk '{print $7}'`  
| /usr/bin/grep 'Unit serial number:'  
Unit serial number: 00000754420A
```

# IBM TS4500 tape library configuration

- Accessible with `itdt` command in JSON format via REST over SCSI
  - Headers and trailers may need to be removed
- Important details of each tape drive:
  - Frame, Column, Row position
  - Serial number
  - Drive type and model
  - SCSI element address

```
[root@tpsrv300 ~]# /opt/itdt/itdt -f /dev/sg3 RoS GET /v1/drives

```

Decrement by 1 (because CTA RMC numbering starts from 0) to get the control path

# New semi-automated system – overview

- Deploy JSON or XML library configuration files in the /etc/cta-ops directory on all tape servers
  - Preparation of those files is a manual step but they need to be updated very rarely (only when an existing library is modified (drives added / removed) or when a new one is installed = annually or less frequently)
- No need for separate tape drive naming conventions configuration, it is automatically generated by the new script in this format: Library-DriveType-Position
  - IBMLIB4-TS1160-F14C2R1
  - SPECTRALIB2-LT09-F05B3S4
- Constraint of this approach:  
Do not connect tape drives from different libraries on the same tape server

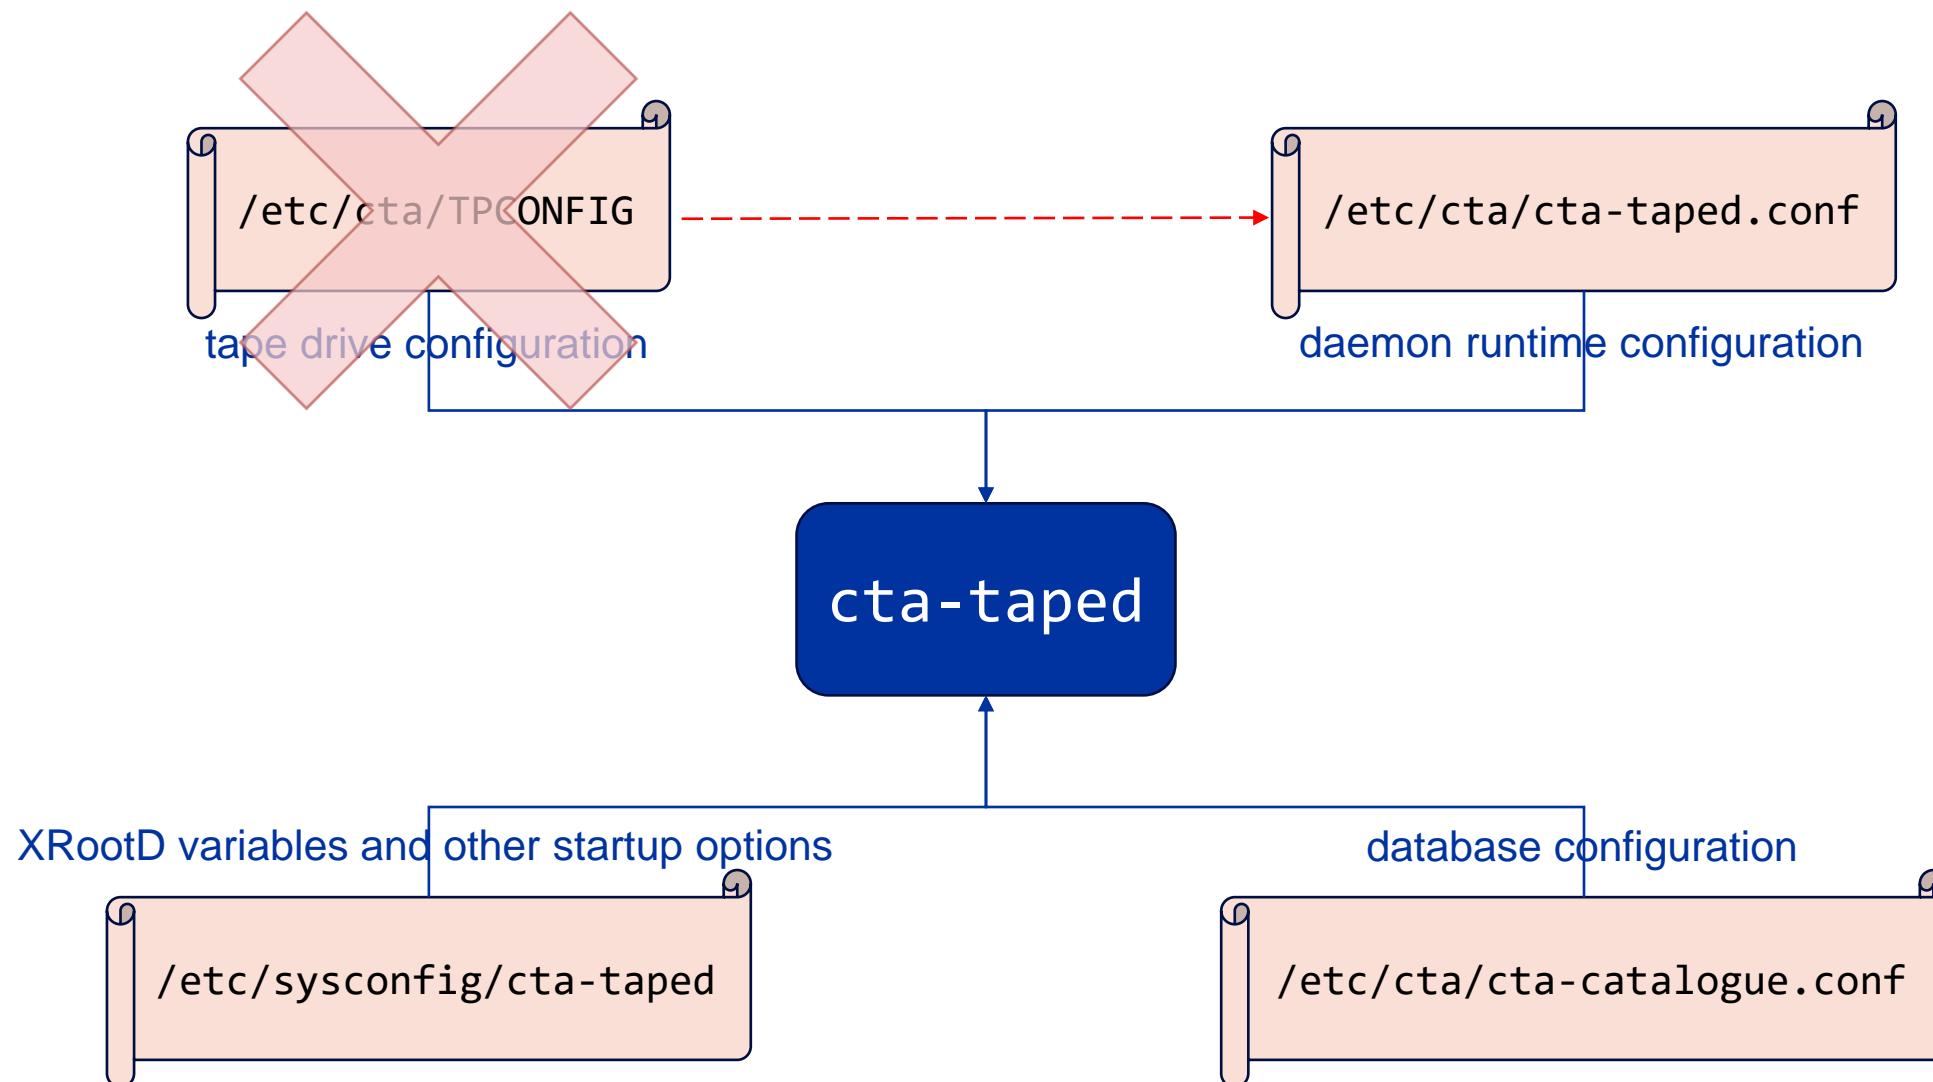

# New semi-automated system – sample script output

- Overview of the steps: *identify SCSI media changer device* → *detect the library serial number* → *detect all connected tape drives* → *map tape drives to st driver devices* → *combine all the data and generate the configuration*

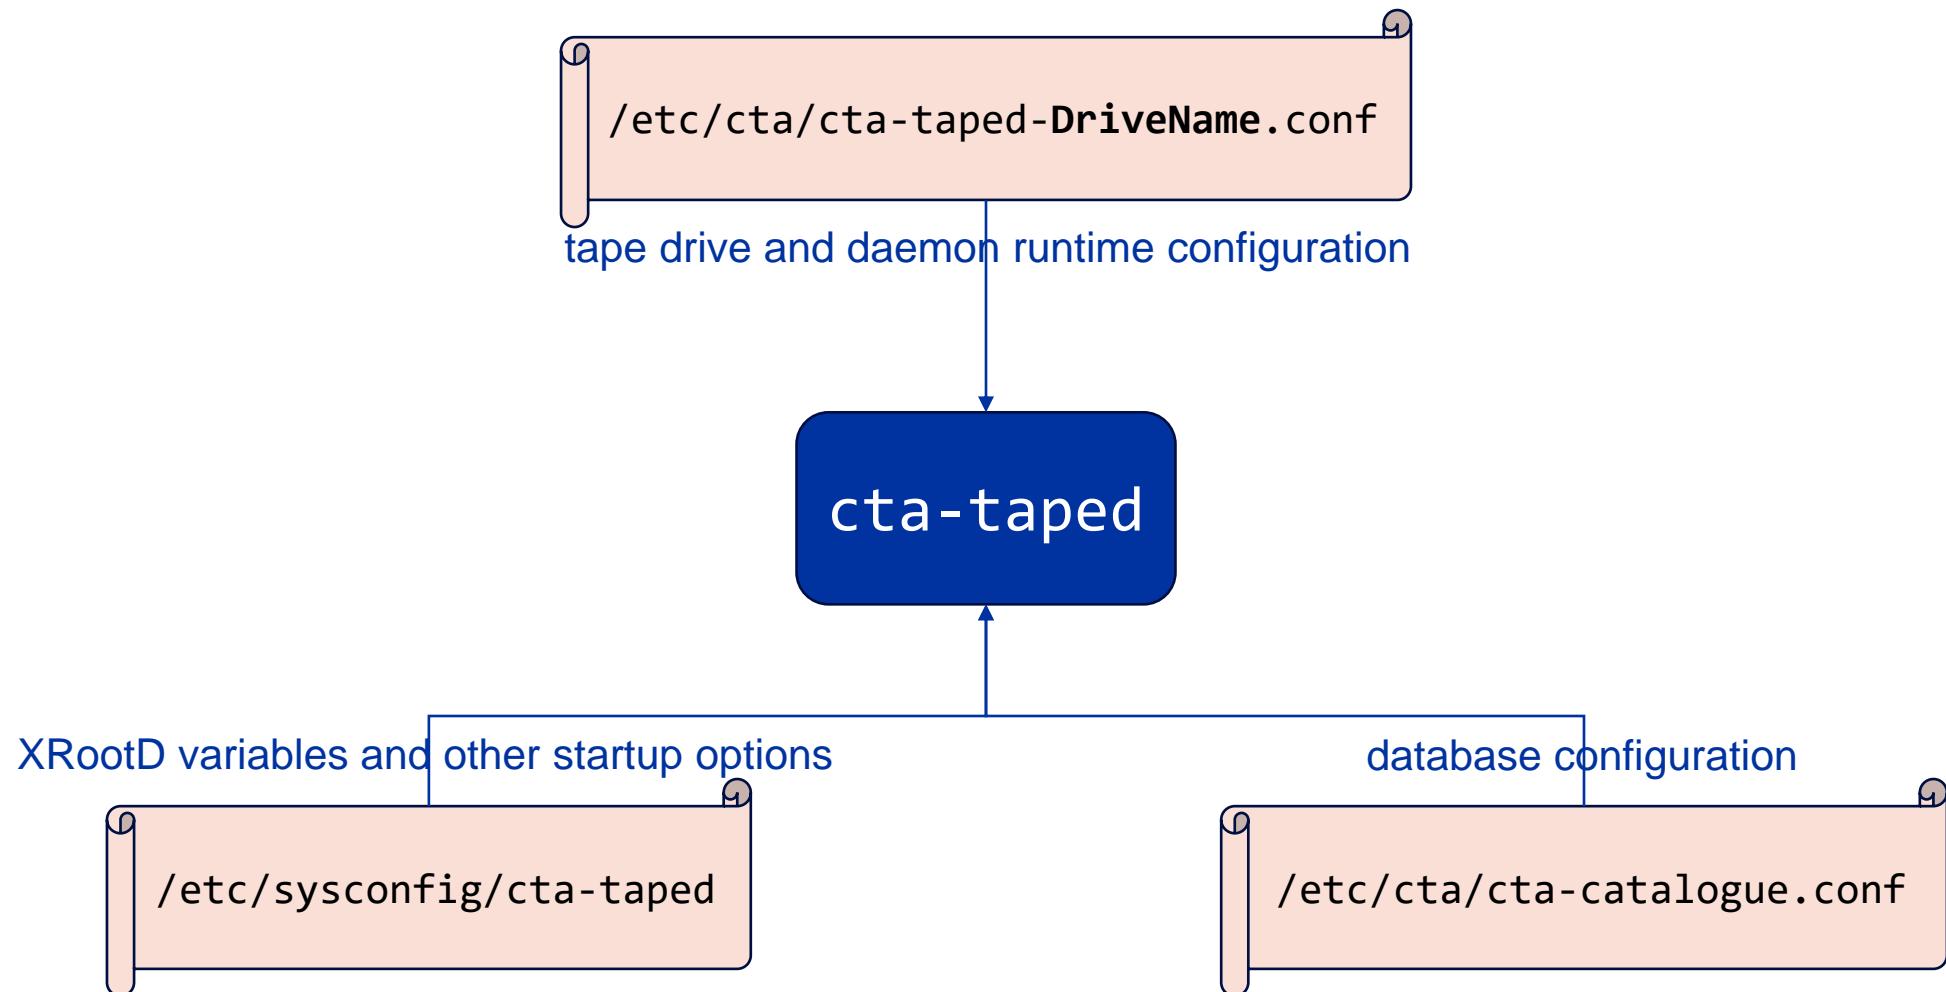

```
[root@tpsrv454 /]# cta-ops-drive-config-generate
2024-02-19 16:48:16 [INFO] [get_scsi_media_changer] Detected first SCSI media changer device: /dev/sg1

# Current structure of cta-taped configuration files

# New structure of cta-taped configuration files

# New CTA's tape daemon configuration file

- Old TPCONFIG information will be moved to the cta-taped configuration file
- Each drive will require its own configuration file
- More granularity on drive configuration for multidrive setups
  - CTA drive parameters

```
[root@tpsrv454 ~]# cat /etc/cta/cta-taped-IBMLIB4-TS1160-F2C1R4.conf
[ ... ]
# DRIVE OPTIONS
#
# The name of the drive. Will be included for every line in the logs.
# This can help identifying
# a problematic maintenance process of the drive after log aggregation.
taped DriveName IBMLIB4-TS1160-F2C1R4

# CTA's logical library the tape drive will be linked to.
taped DriveLogicalLibrary IBMLIB4-TS1160

# Path to the character special device used to access the drive.
taped DriveDevice /dev/nst0

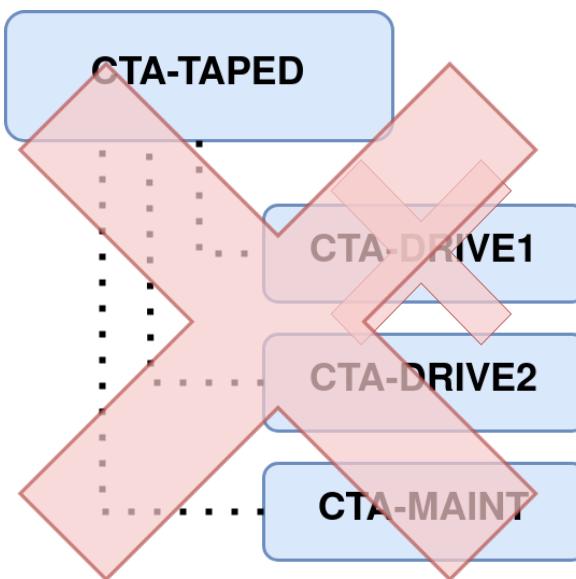

# The SCSI media changer address of the drive. This is "smc" + the
# drive ordinal number of the device, which can be obtained with "cta-
# smc -q D"
taped DriveControlPath smc3

[ ... ]
```

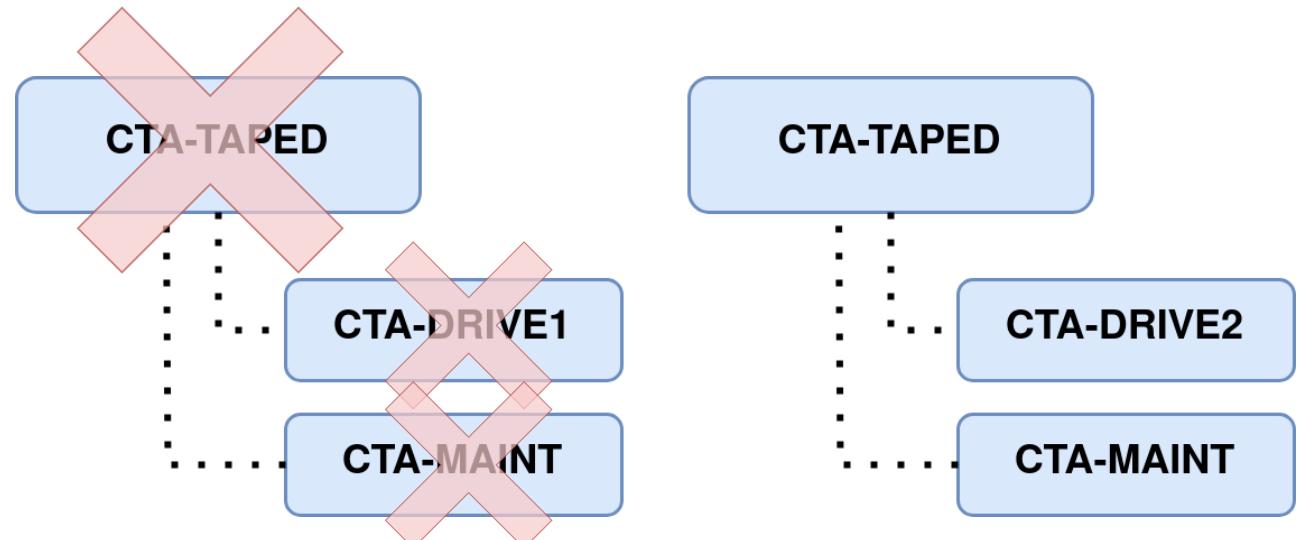

# New process topology

- Old topology

- New topology

- This new topology grants tape server independence from single drive failure
- Limit OS resources on a per process basis

# New process topology – example

- Multiple drives running as independent processes

```
[root@tpsrv454 ~]# pstree -a | grep cta-
|-cta-rmcd /dev/smc

# Migrating to the new setup

- Problem: tape and drive have to be in the same logical library, otherwise the tape will not get mounted
- The script to generate drive configuration has an option to map the new library names to the legacy format:  
  --use-legacy-mapping
- Possibility to deploy in two steps:
  1. Upgrade CTA taped while using old library names
  2. Update tape logical library field in the catalogue information and `cta-taped-DriveName.conf` files

```
[root@tpsrv454 ~]# cat /etc/cta-ops/cta-ops-config.yaml
[...]
  legacy_library_mapping:
    IBMLIB1-LT08: 'IBM1L8'
    IBMLIB1-LT09: 'IBM1L9'
    IBMLIB3-TS1160: 'IBM360'
    IBMLIB3-TS1170: 'IBM370'
    IBMLIB4-TS1160: 'IBM460'
    IBMLIB4-TS1170: 'IBM470'
    SPECTRALIB1-LT09: 'SPC1L9'
    SPECTRALIB2-LT09: 'SPC2L9'
[...]
```

Legacy  
library  
names

New  
naming  
convention

# Migrating to the new setup – systemd services

- Moving from one service to pseudo-service with independent CTA taped services

```
[root@tpsrv450 ~]# cat /etc/systemd/system/cta-taped.service

```

# Summary

- Developed new semi-automated system to generate tape drive configuration
  - Uses information provided by the library as a source
  - Extracts the details using the tape drive serial number
- CTA's tape daemon refactored to better support configurations with multiple drives connected to a tape server
- Release status:
  - Will be available in the next CTA public release
  - Currently testing in pre-production at CERN
- Future Work:
  - Make CTA's tape daemon maintenance process independent from the CTA drive process
