

# ATLAS Data Challenges

---

LCG-GDB

September 8th 2004

ATLAS DC; Grid and Operations teams

# ATLAS Data challenges

- ❑ DC1 (2002-2003)
  - Put in place full software chain
    - Simulation of the data
    - Reconstruction
  - Production system
    - Tools (bookkeeping; monitoring; ...)
    - Intensive use of Grid
- ❑ DC2 (Summer 2004)
  - New software
  - New "automated" production system
  - Full use of Grids
  - Test of Computing Model
- ❑ DC3 (Spring 2006)
  - Final test before data taking

# ATLAS-DC2 operation

- ❑ Consider DC2 as a three-part operation:
  - part I: production of simulated data (July-September 2004)
    - running on "Grid"
    - Worldwide
  - part II: test of Tier-0 operation (October 2004)
    - Do in 10 days what "should" be done in 1 day when real data-taking start
    - Input is "Raw Data" like
    - output (ESD+AOD) will be distributed to Tier-1s in real time for analysis
  - part III: test of distributed analysis on the Grid (Oct.-Dec. 2004)
    - access to event and non-event data from anywhere in the world both in organized and chaotic ways
- ❑ Requests
  - ~30 Physics channels ( 10 Millions of events)
  - Several millions of events for calibration (single particles and physics samples)

# More on Phase I: Data preparation

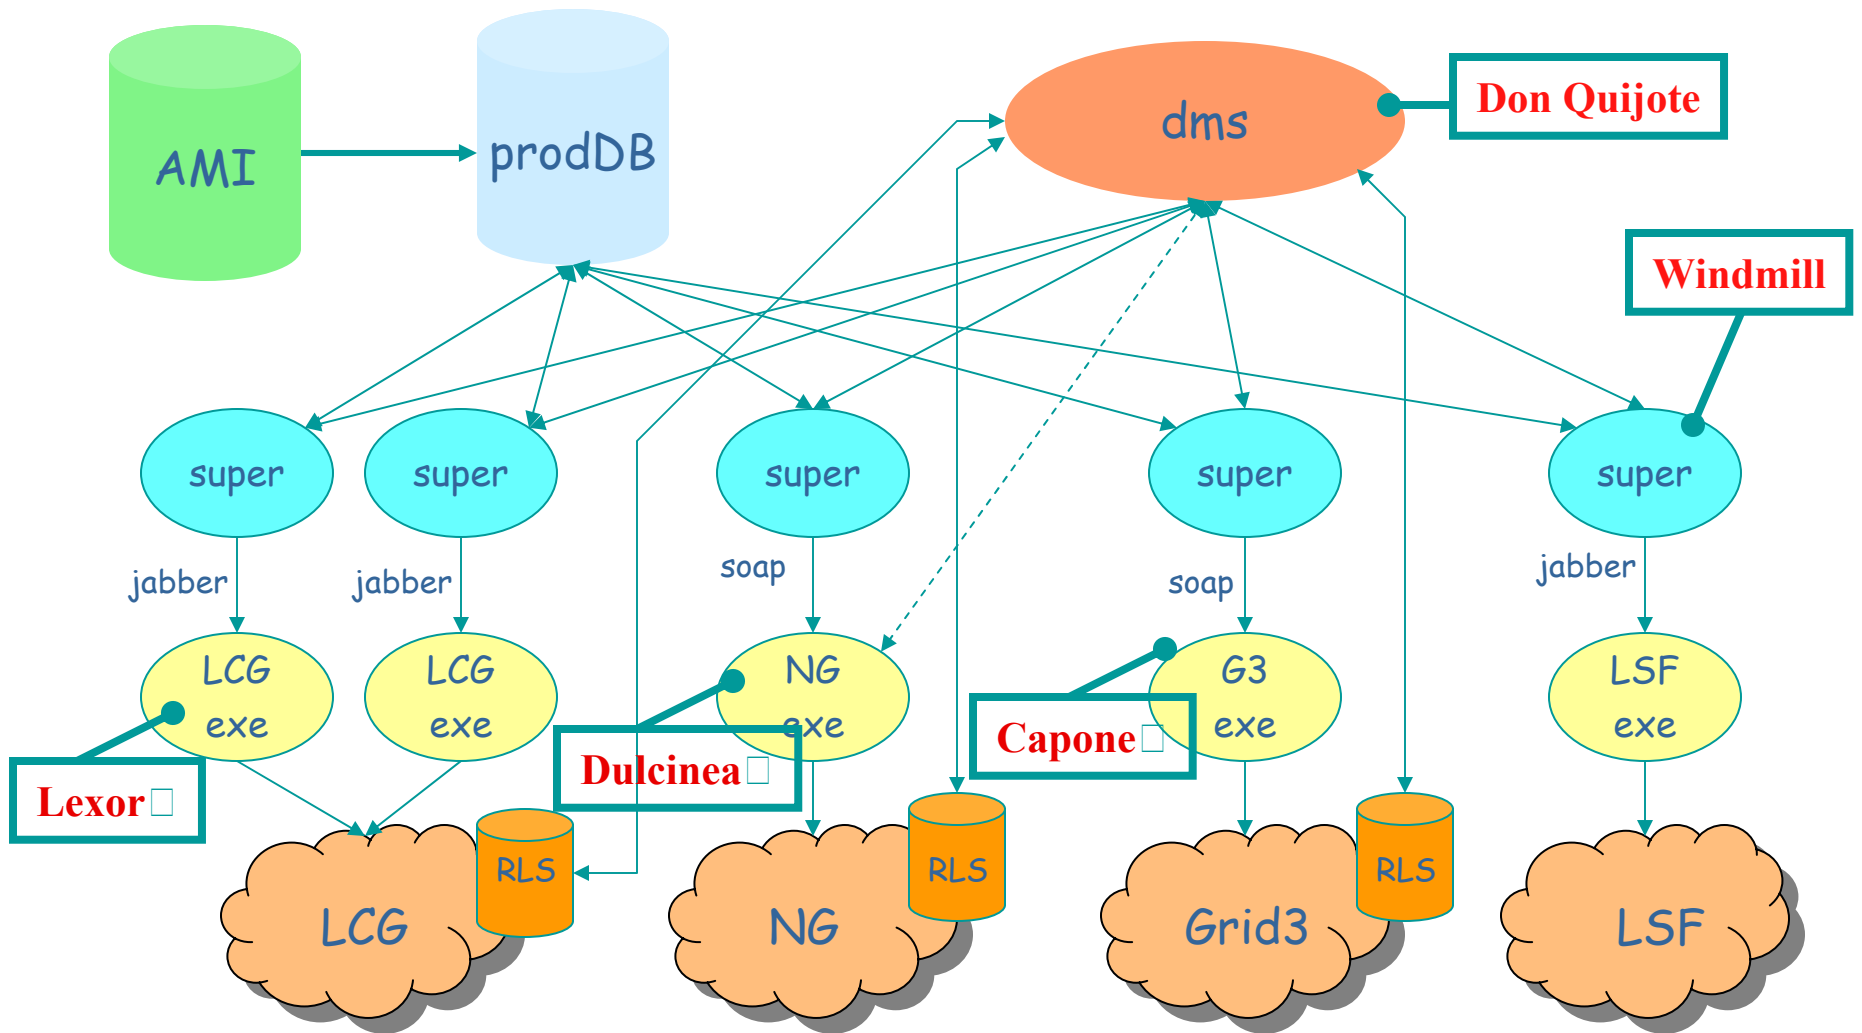

- DC2 Phase I
  - Part 1: Event generation
    - Physics processes --> 4-momentum of particles
    - Several Event generators (Pythia; Herwig; ...)
  - Part 2: Detector simulation (Geant4)
    - Tracking of particles through the detector
    - Records interaction of particle with sensitive elements of the detector
  - Part 3: Pile-up and digitization
    - Pile-up: superposition of "background" events with the "signal" event
    - Digitization: response of the sensitive elements of the detector
    - Output, called byte-stream data, "looks-like" "Raw Data"
  - Part 4: Data transfer (to CERN Tier-0)
    - ~35 TB in 4 weeks
  - Part 5: Event mixing
    - Physics events are "mixed" in "ad-hoc" proportion

# ATLAS Production System

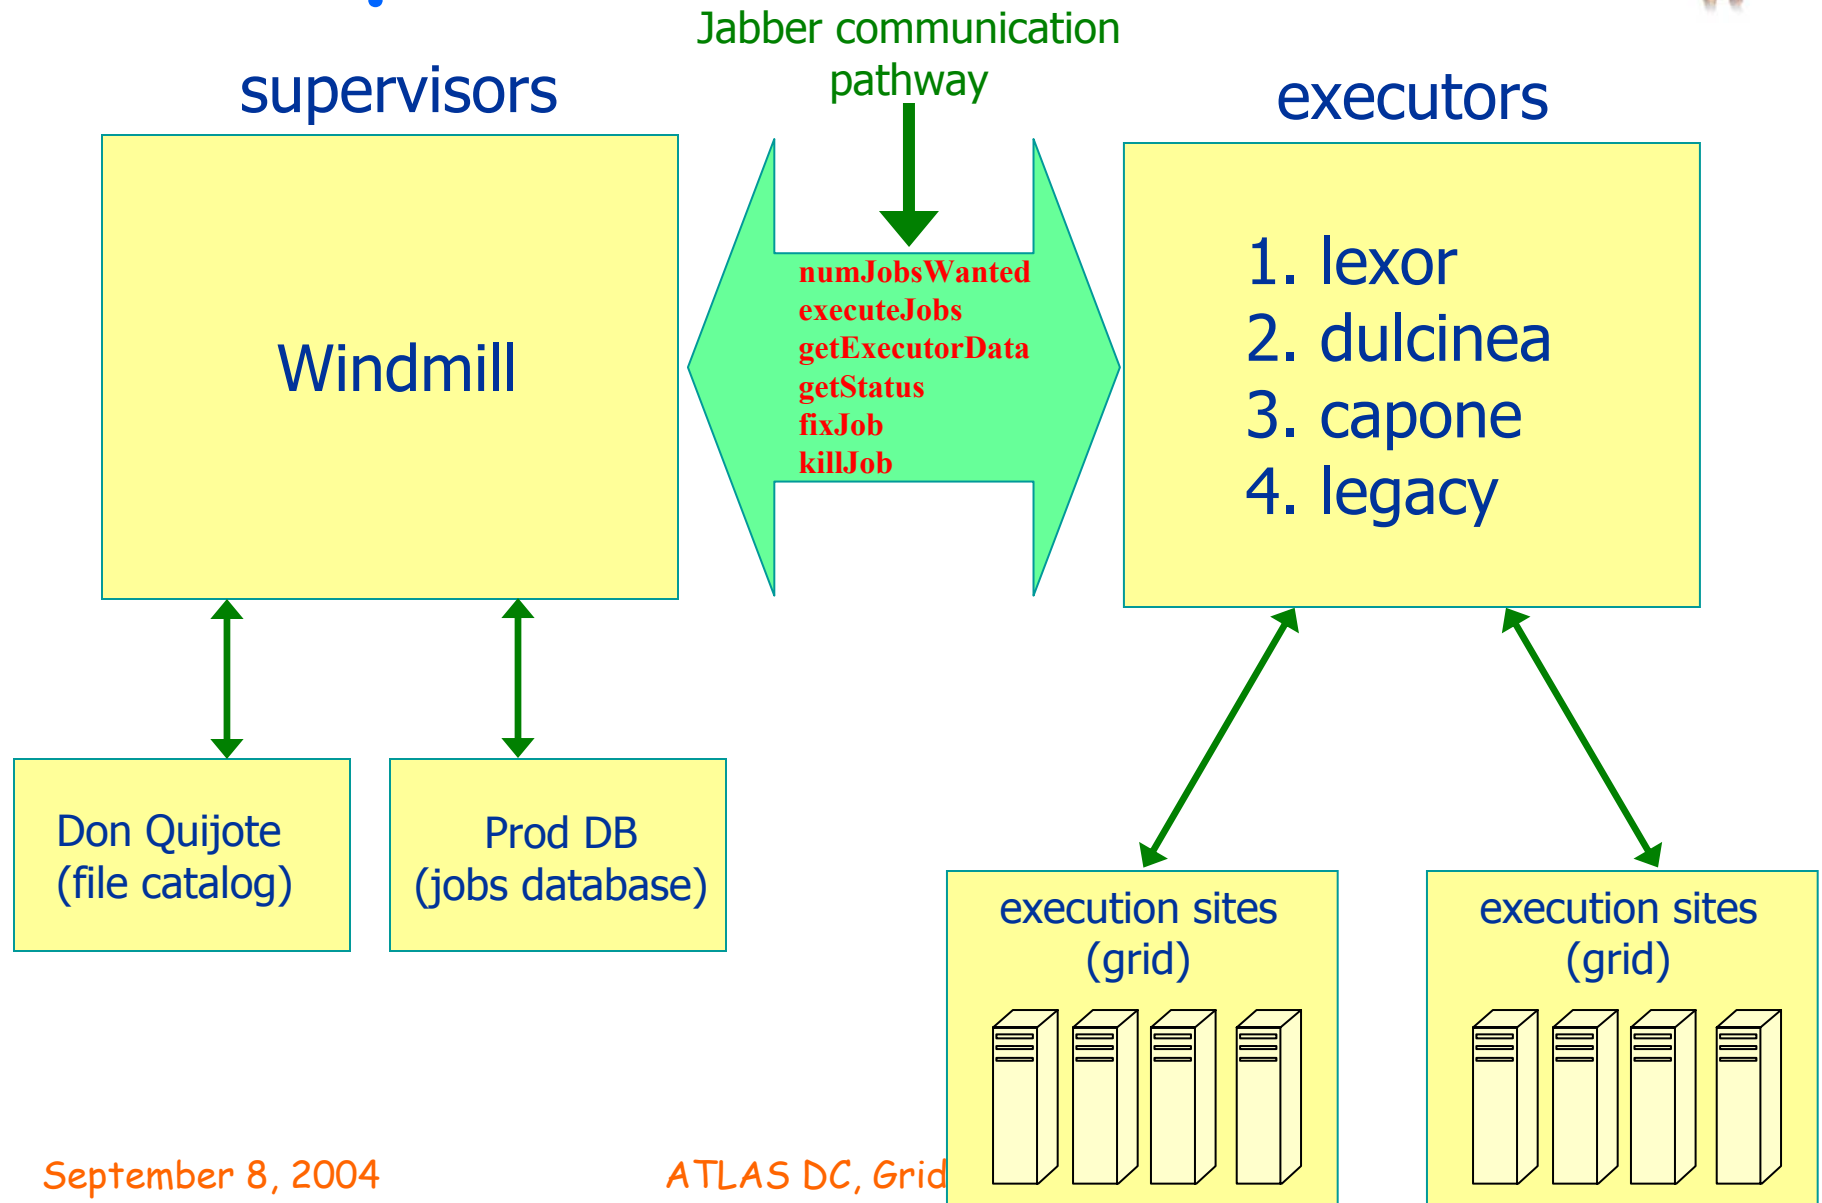

- ❑ Automated version of previous ATLAS DC1 production system
- ❑ Components
  - Supervisor: Windmill (US)
  - Executors (one per Grid or "legacy batch") :
    - Capone (Grid3) (US)
    - Dulcinea (NordusGrid) (Scandinavia)
    - Lexor (LCG) (Italy)
    - "Legacy systems" (Germany-FZK; France-Lyon)
  - Data Management System (DMS): Don Quijote (CERN)
  - Bookkeeping: AMI (LPSC-Grenoble)
  - Production Data base (Oracle)
    - Definition and status of the jobs

# ATLAS Production system

# Supervisor - Executors

September 8, 2004

ATLAS DC, Grid

# ATLAS DC2 Phase I

- ❑ Started beginning of July and still running
- ❑ On 3 Grids
  - LCG
    - Including some non-ATLAS sites (Legnaro, Torino)
    - Using in production mode the LCG-Grid-Canada interface
      - 3 sites are accessible through this interface(TRIUMF)
        - Uni. Victoria, Uni. Alberta and WestGrid(SFU/TRIUMF)
  - NorduGrid
    - Several Scandinavian super-computer resources
  - Grid3
    - Harnessing opportunistic computing resources that are not dedicated to ATLAS (e.g. US CMS sites)

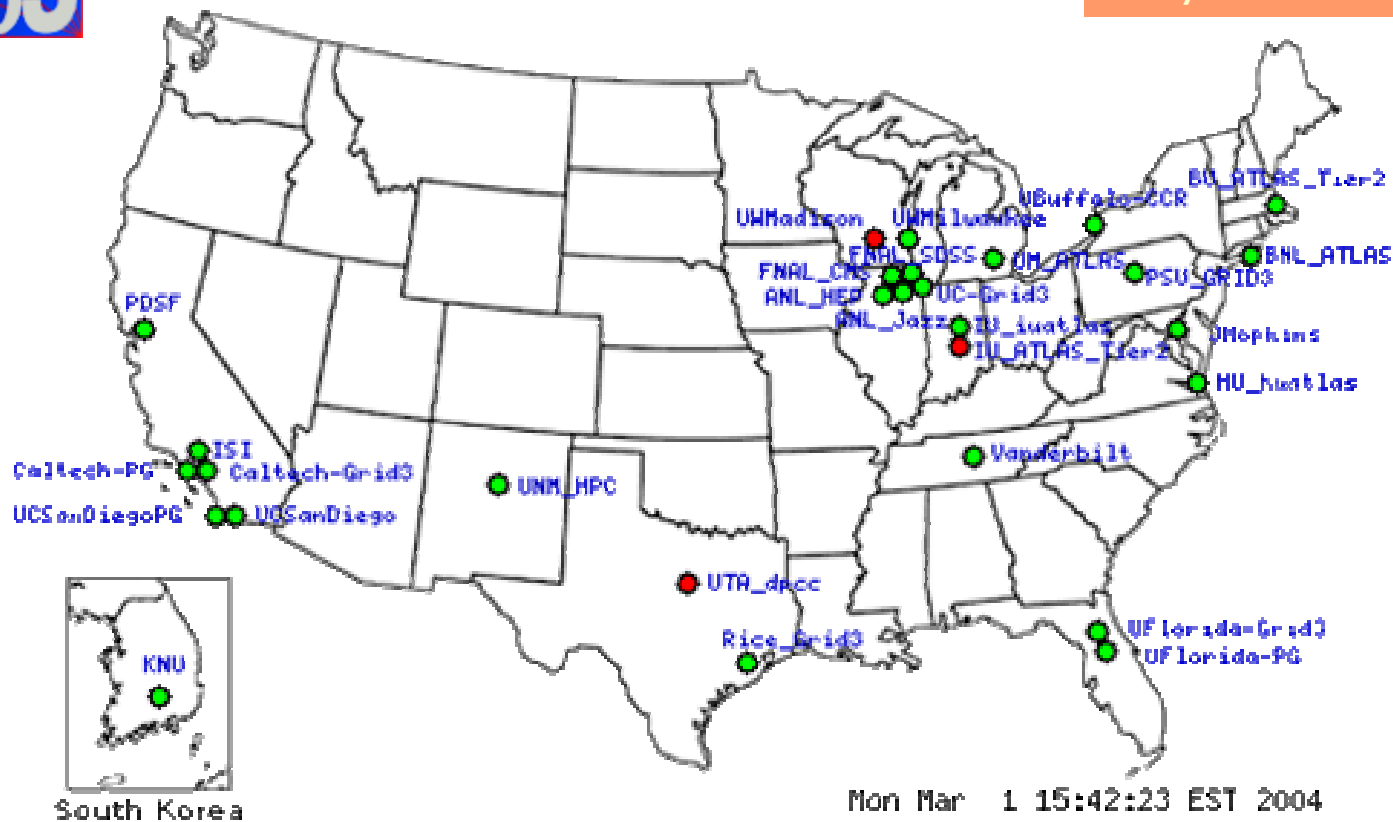

# Current Grid3 Status (3/1/04)

(<http://www.ivdgl.org/grid2003>)

- 28 sites, multi-VO
- shared resources
- ~2000 CPUs
- dynamic – roll in/out

# NorduGrid & Co. Resources:

Site capacity, CPUs

- 1 - 10
- 10 - 50
- 50 and more
- ▲ planned

7 countries:

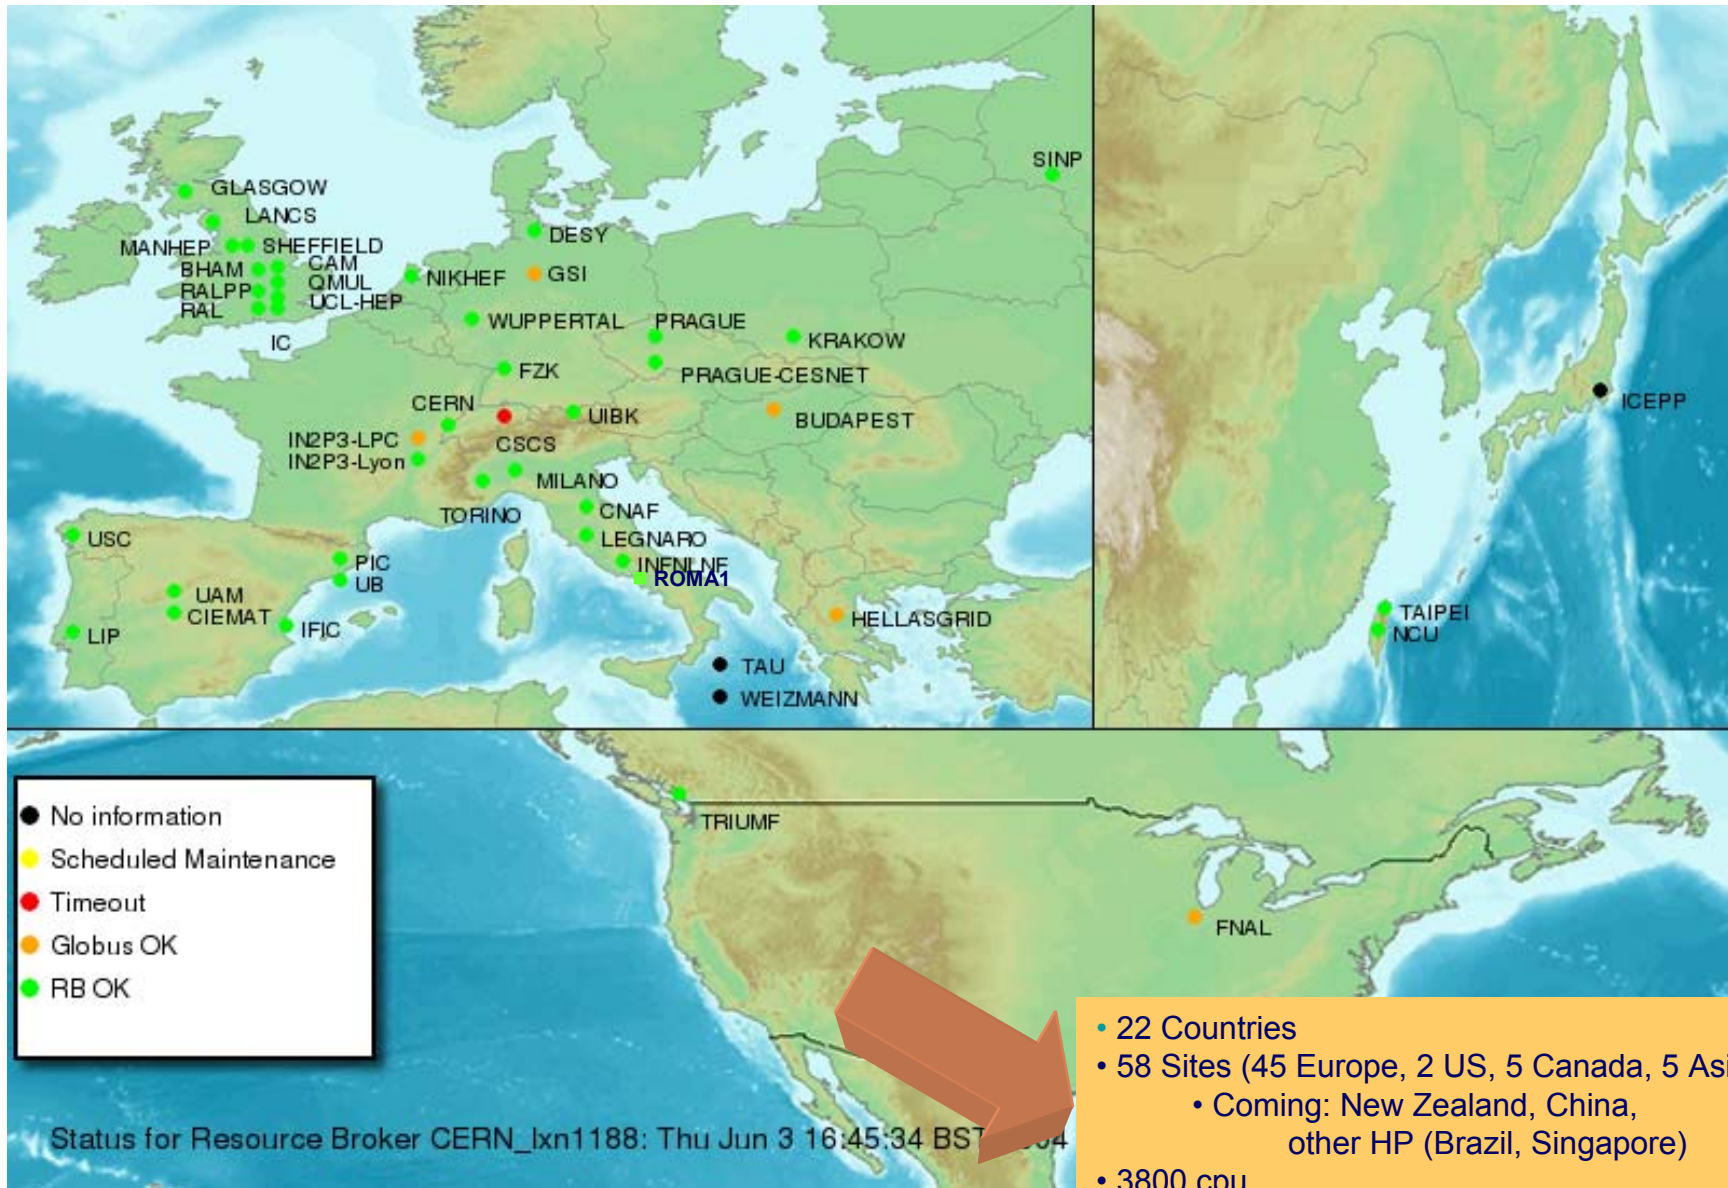

- SITES FOR ATLAS
  - Dedicated: 3, the rest is shared
- CPUs for ATLAS: ~3280
  - Effectively available: ~800
- Storage Elements for ATLAS: 10
  - Capacity: ~14 TB, all shared

ATLAS DC, Grid & Opel

# Sites in LCG-2: 4 June 2004

# ATLAS DC2 Phase I

## □ Main difficulties at the initial phase

- For all Grids
  - Debugging the Production System
  - On LCG and Grid3 several instances of the Supervisor have to be run for better coping with the instability of the system. As a consequence the Production System was more difficult to handle.
- LCG
  - Mis-configuration of sites; Information system (wrong or missing information); Job submission and Resource Broker; Jobs ranking.
  - Data management(copy & register); Stage in/out problems
- NorduGrid
  - Replica Location Service (Globus) hanging several times per day
  - Mis-configuration of sites
  - Access to the conditions database
- Grid3
  - Data Management - RLS interactions
  - Software distribution problems
  - Load on gatekeepers
  - Some problems with certificates (causing jobs to abort)
- Good collaboration with Grid teams to solve the problems

# ATLAS DC2 Phase I

- ❑ Not all problems solved
  - NorduGrid
    - RLS; Access to the conditions database; Storage elements died ...
  - Grid3
    - Try to avoid single points of failure (adding new servers)
    - Lack of storage management in some sites
  - LCG
    - Still some problems with resource broker and information system
    - And data management (copy and register) and stage in/out problems
  - For all
    - Slowness of the response of the Production Database
      - Problem that appears after ~6 weeks of running and which is still not fully understood (mix software and hardware problems? being worked with IT-DB).
      - Has been solved!
- ❑ Consequences: we did not succeed (yet) to run as many jobs as expected per day
- ❑ Nevertheless should be completed by end-September and is "Grid" only

### ATLAS DC2 - Number of jobs - September 6

### ATLAS DC2 - Failures on LCG

**Preliminary**

**On-going Analysis**

# Summary (1)

- ❑ Major efforts on the past few months
  - Redesign of the ATLAS Event Data Model and Detector Description
  - Integration of the LCG components (G4; POOL; ...)
  - Introduction of the **Production System**
    - Interfaced with 3 Grid flavors (and "legacy" systems)
- ❑ Delays in all activities have affected the schedule of DC2
  - Note that Combined Test Beam is ATLAS 1st priority
  - And DC2 schedule was revisited
    - To wait for the readiness of the software and of the Production system

# Summary (2)

## ❑ DC2

- About 80% of the *Geant4* simulation foreseen for Phase I has been completed using only *Grid* and using the 3 flavors coherently; Pile-up just starting
- The 3 *Grids* have been proven to be usable for a real production and this is a major achievement

## ❑ BUT

- Phase I progressing slower than expected and it's clear that all the involved elements (*Grid* middleware; Production System; deployment and monitoring tools over the sites) need improvements
- It's one of the goals of the Data Challenges to identify these problems as early as possible.

## ❑ Phase II (Tier0 exercise) is scheduled for October
