

ARDA Workshop, CERN October, 21st, 2004

“ALICE @ ARDA” Interactive Analysis on a GRID

P. Cerello on behalf of the ALICE Offline Team

Outline

1. The ALICE Physics Data Challenge
2. Summary of phase I / II
3. Phase III
 1. What?
 2. How?
 3. When?
4. Summary & Outlook

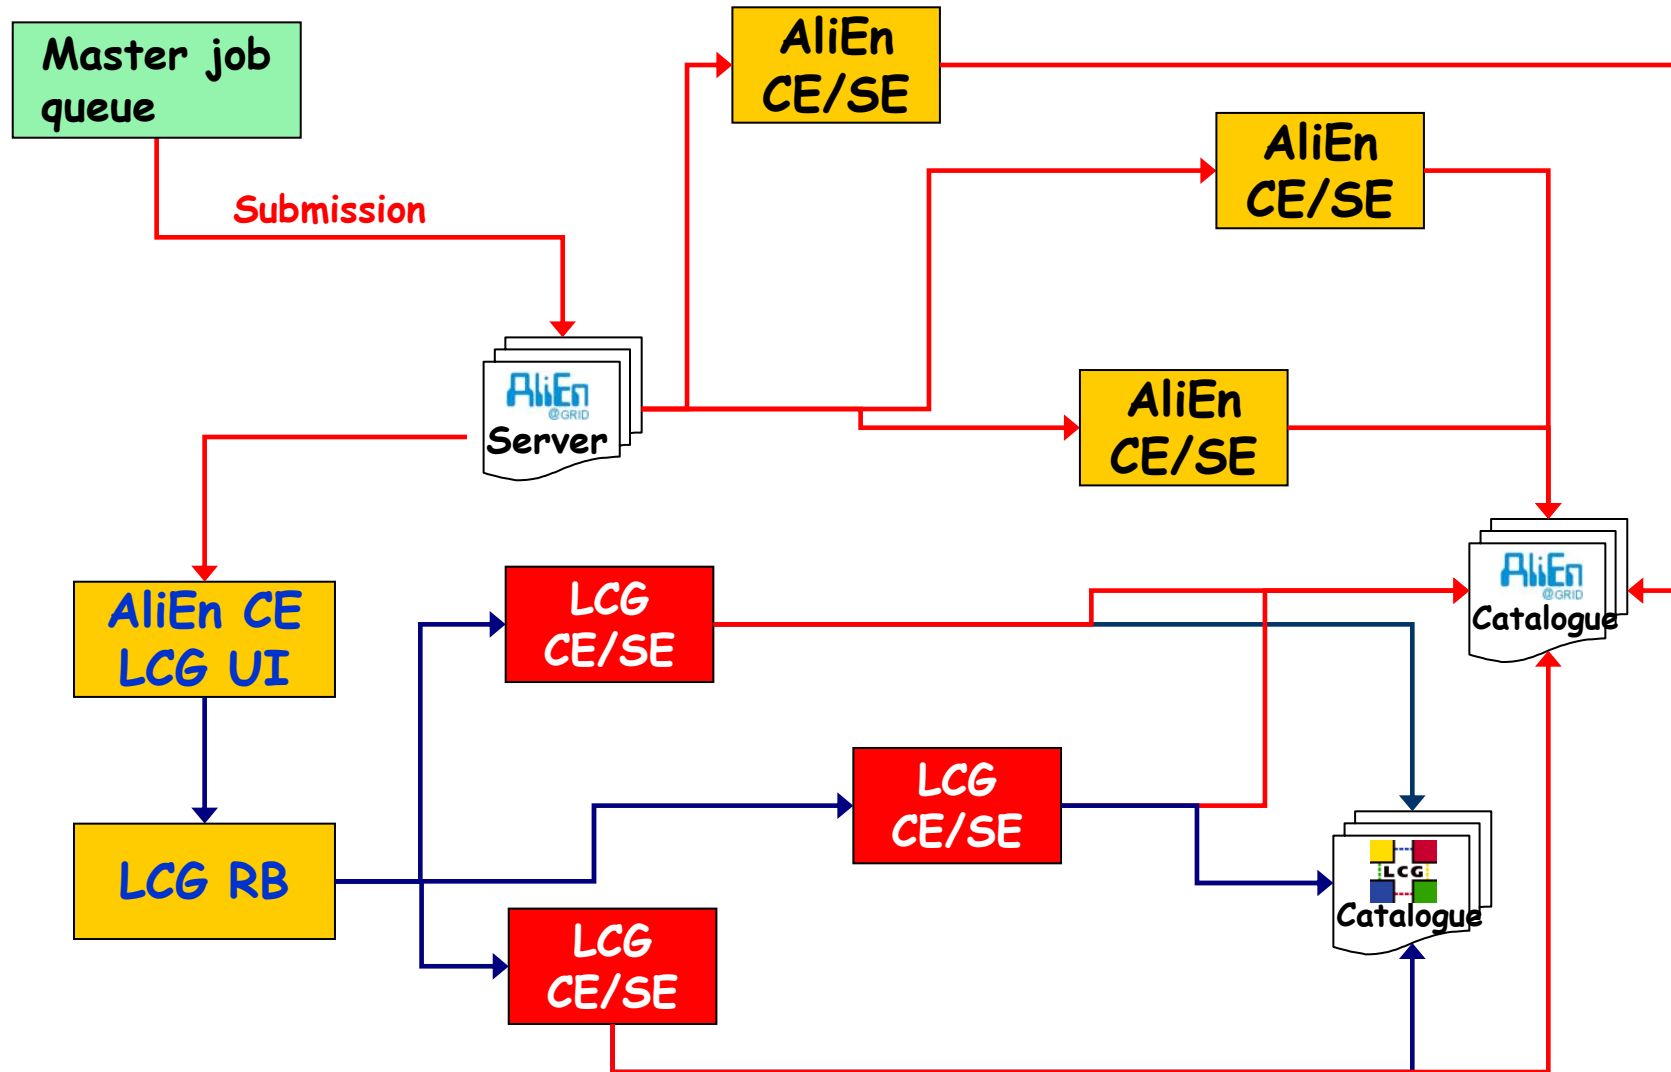

The ALICE Physics Data Challenge

- Phase 1 - production of underlying events using heavy ion MC generators
 - Status: 100% complete (Mar-May 2004)
 - Basic statistics - ~ 1.3 million files, 26 TB data volume
- Phase 2 – mixing of signal events in the underlying events
 - Status: 100% complete (Jun-Sep 2004)
- Phase 3 – analysis of signal + underlying events
 - Goal – to test the data analysis model of ALICE
 - Status – to be started

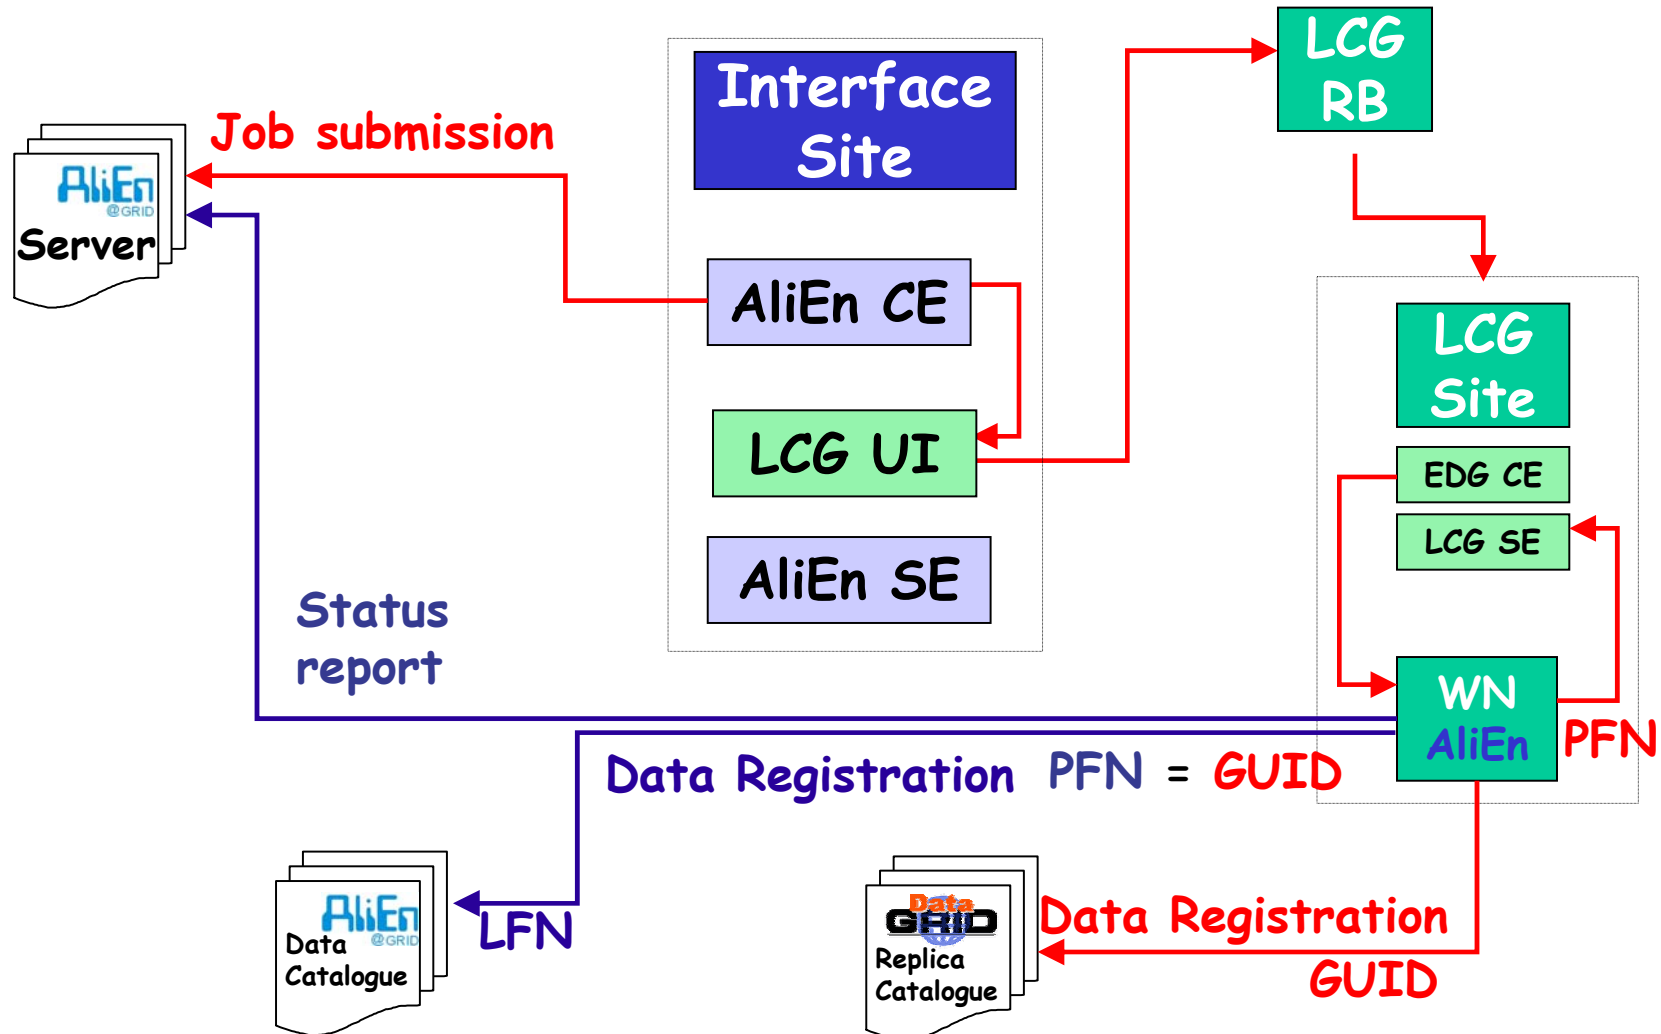

Phase I & II layout: a "Meta-Grid"

Interfacing AliEn and LCG

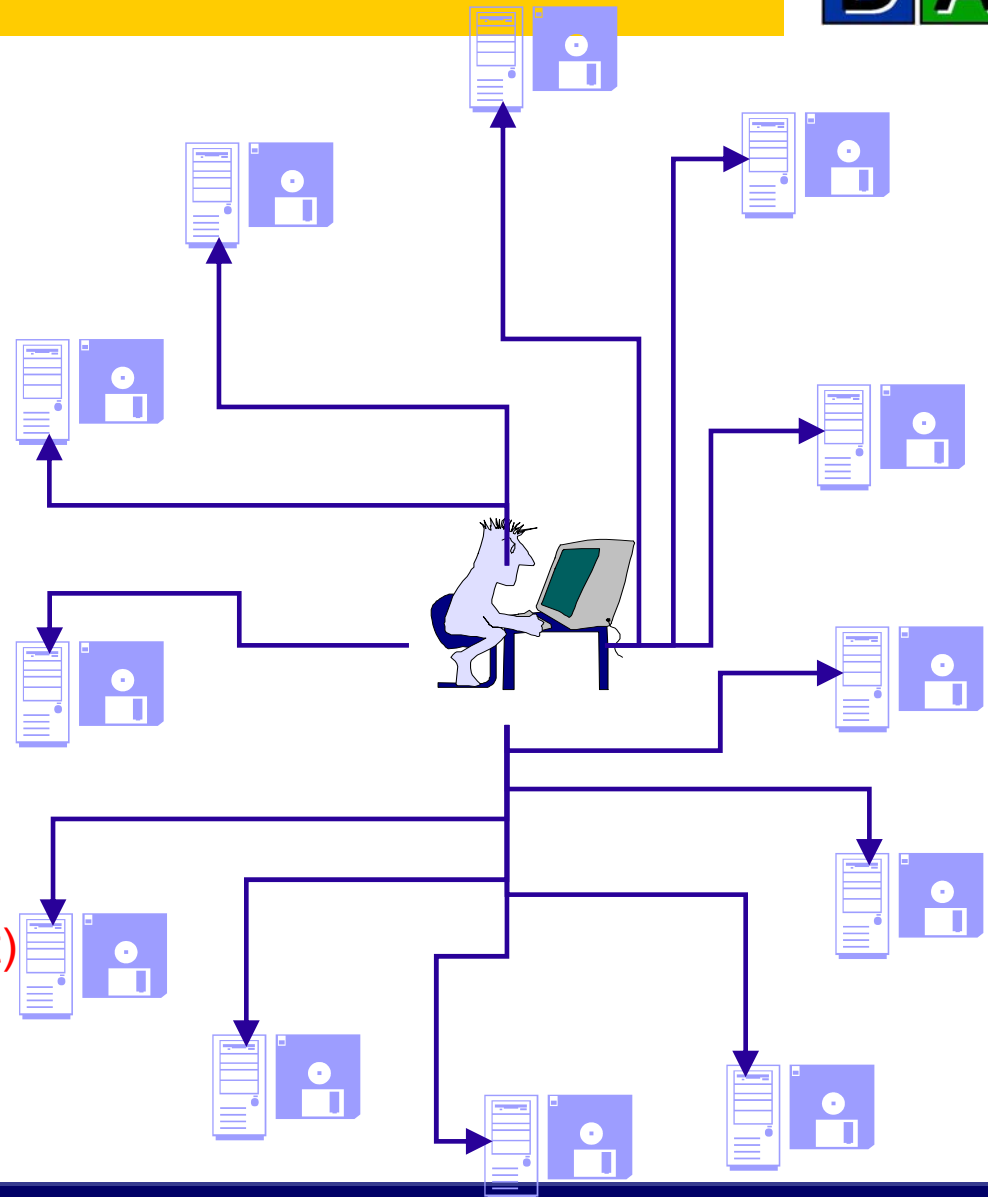

Phase I - Simulation

Small input with interaction conditions

Large **distributed** output (1 GB/event)
with simulated detector response
Long execution time (10 hours/event)

Phase I results

Jobs done

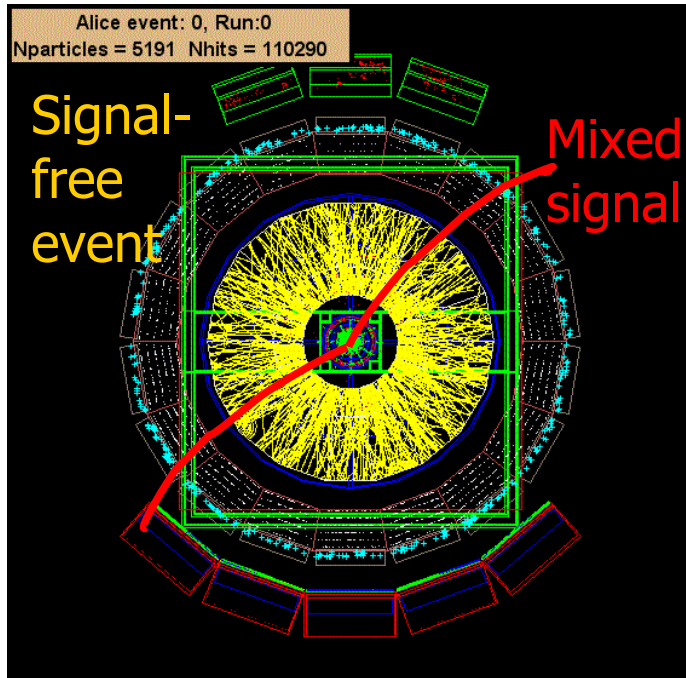

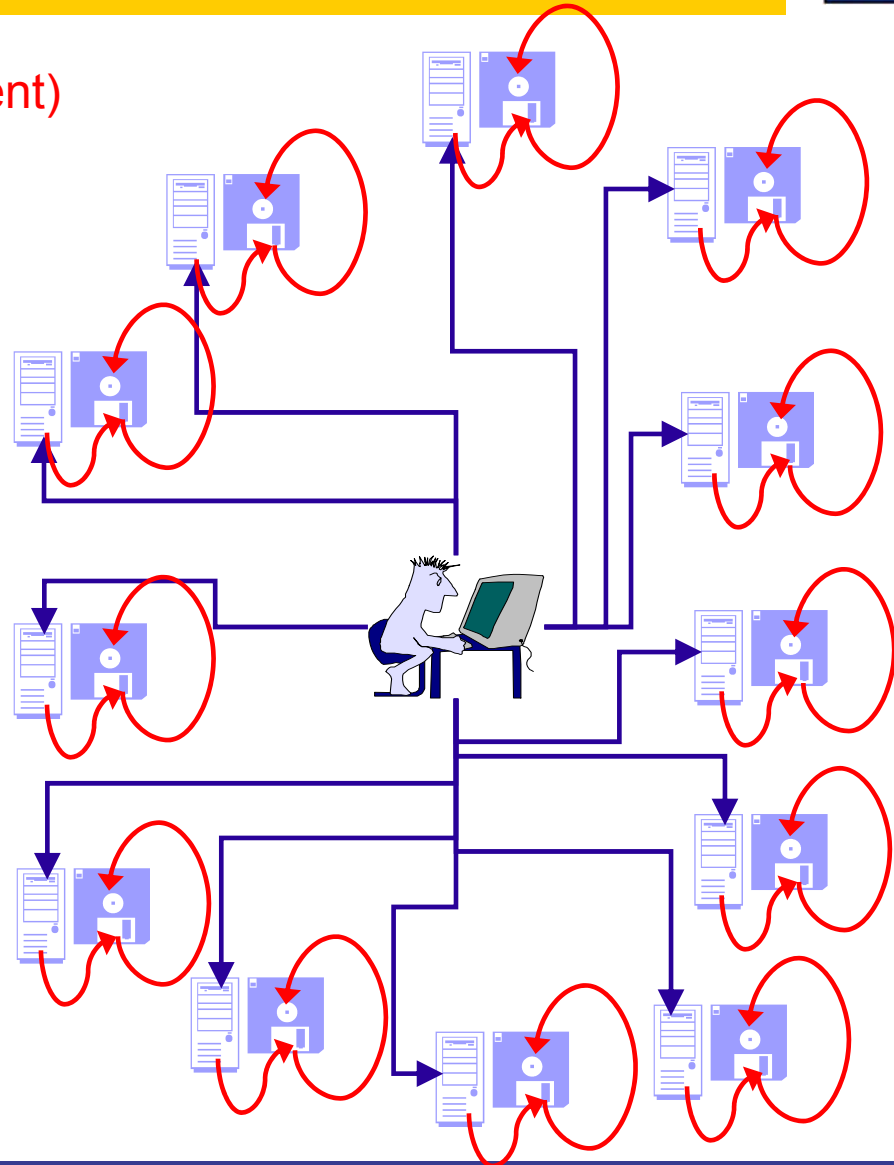

Phase II - Merging & Reconstruction

Large **distributed** input (1 GB/event)

Fairly Large **distributed** output (100 MB/event, 7MB files) with reconstructed events

Phase II results

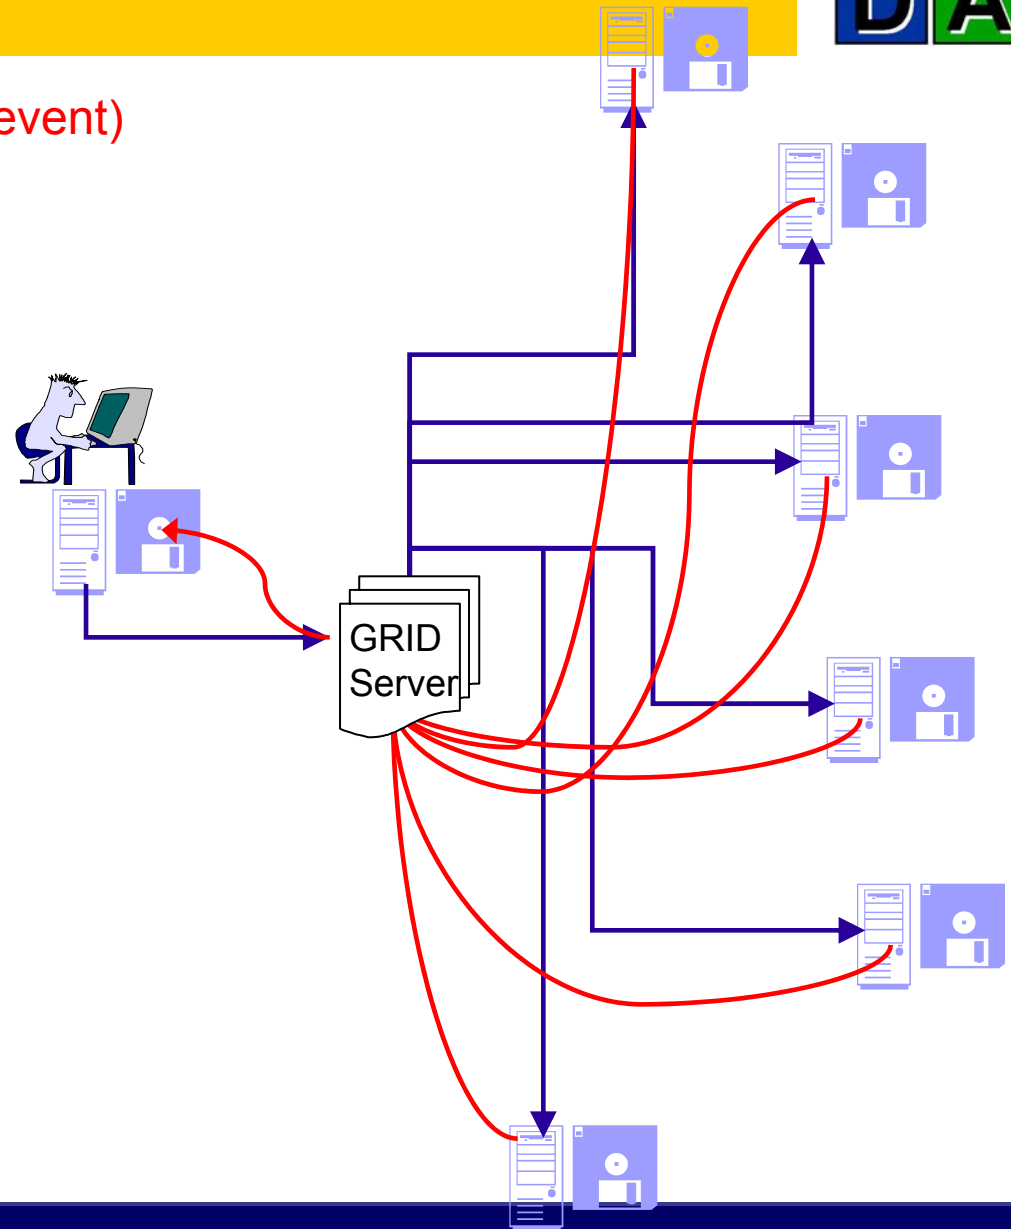

Phase III – (Interactive) Analysis

Large distributed input (100 MB/event)

Fairly small merged output

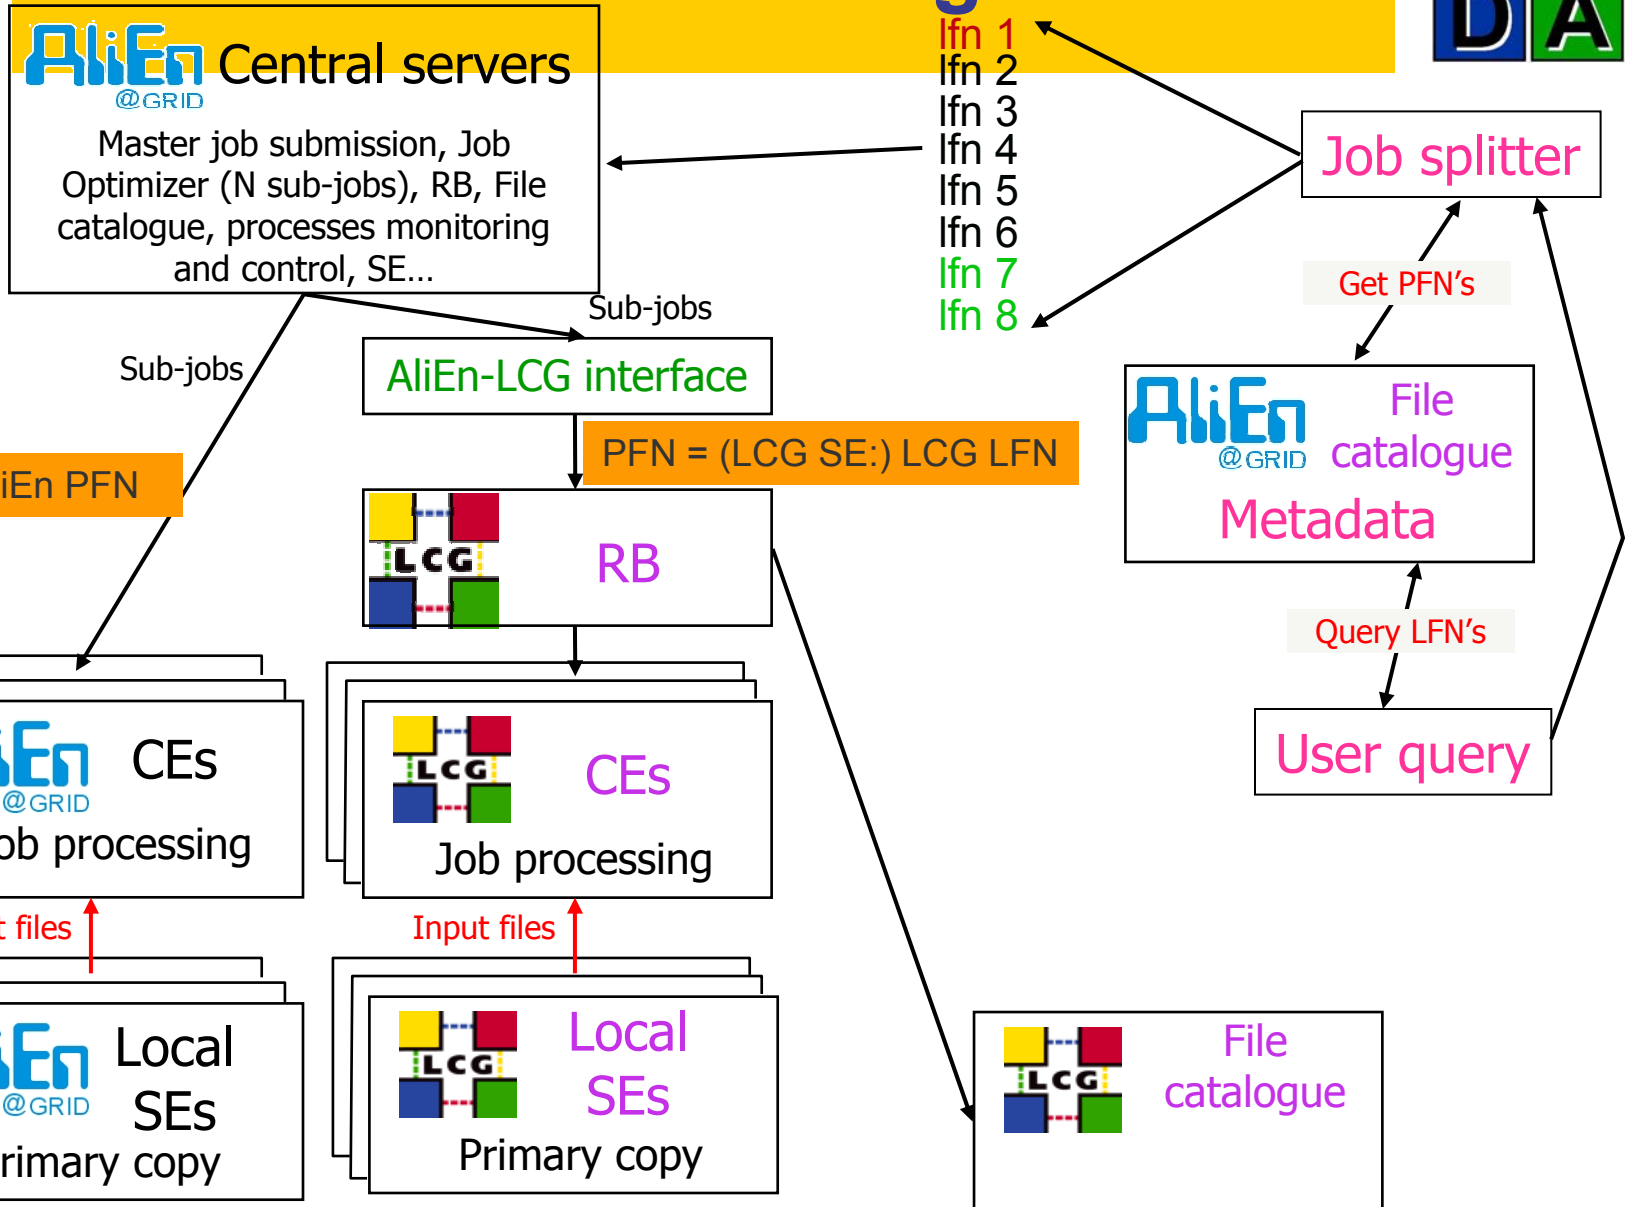

Phase III - Design strategy

- Distributed Input
 - 5.4 M files, on about 30 different SEs
- Do not move the input
 - Algorithm definition by a user on site S
 - On site S, Input Query to the Data Catalogue, based on selected MetaData
 - Input files typically from many SEs, so
 - Split them in N subgroups defined by files stored on a given SE
 - Split the task into N sub-tasks, to be run in parallel on the CEs associated to SEs containing a fraction of the input files
 - Run the N sub-tasks in parallel
 - Merge the output on the user's site S
- How?
 - From a ROOT shell on the user's site
 - Hopefully interactively with PROOF
 - Refer to Derek's and Andreas' presentation yesterday

Phase III - Original Plan

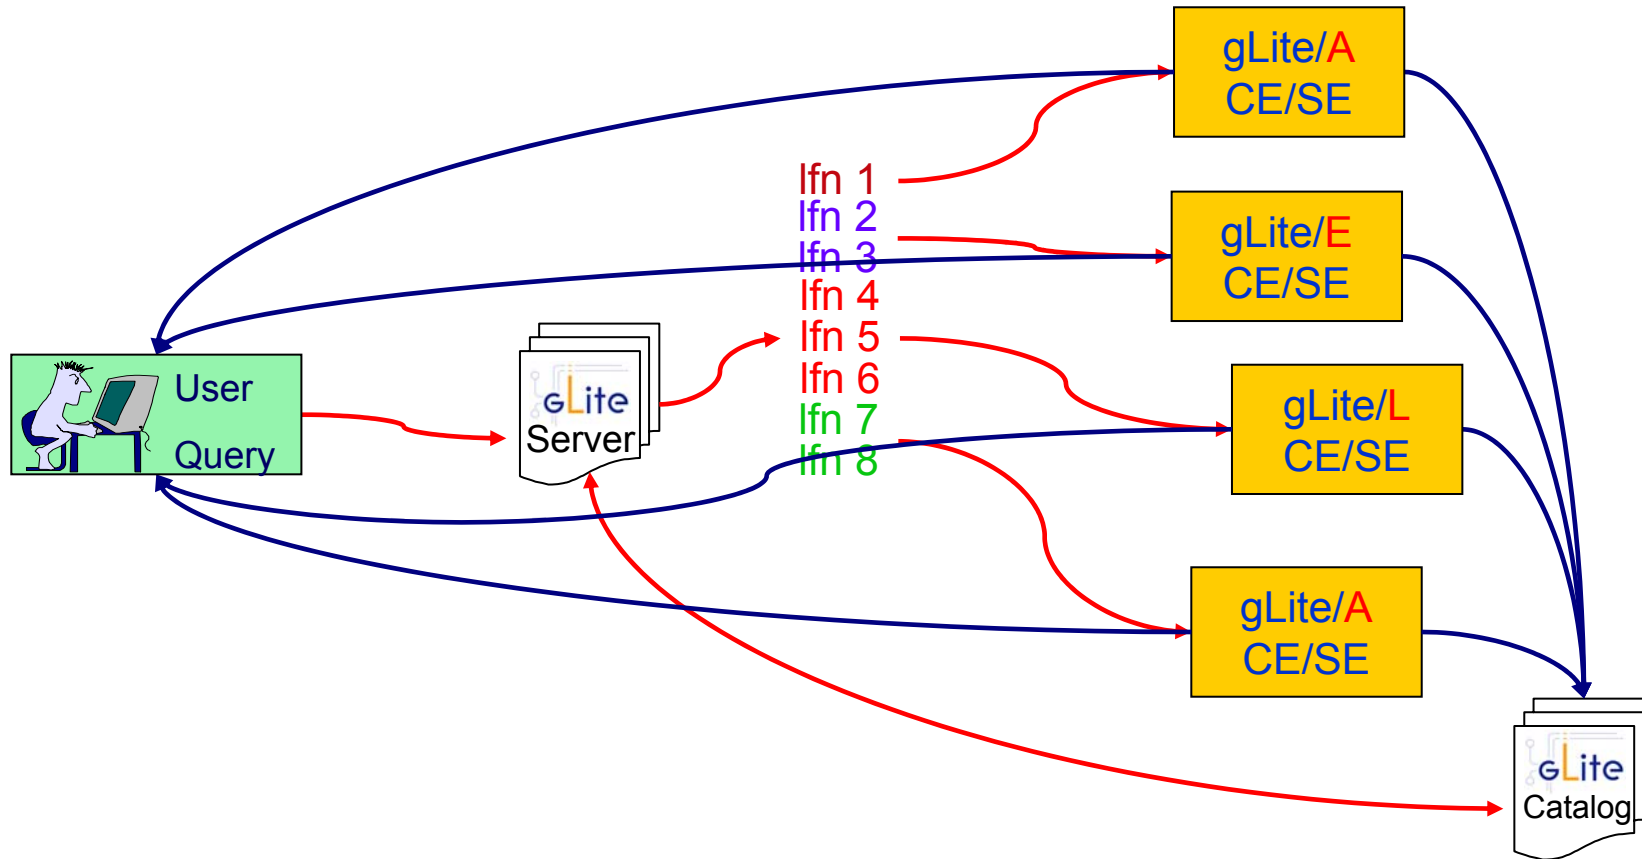

Phase III - Execution Strategy

- Very labour intensive
 - The status of LCG DMS is not brilliant
- Does not “leverage” the (excellent!) work done in ARDA
- So... why not doing it with gLite?
- Advantages
 - Uniform configuration: gLite on EGEE/LCG-managed sites & on ALICE-managed sites
 - If we have to go that way, the sooner the better
 - AliEn is anyway “frozen” as all the developers are working on gLite/ARDA
- Disadvantages
 - It may introduce a delay with respect to the use of the present – available – AliEn/LCG configuration
 - But we believe it will pay off in the medium term

Phase III - Layout

Phase III – The Plan

- ALICE is ready to play the guinea-pig for a large scale deployment
 - i.e. on all ALICE resources and on as many existing LCG resources as possible
- We have experience in deploying AliEn on most centres, we can redo the exercise with gLite
 - Even on most LCG centres we have a parallel AliEn installation
 - Many ALICE site-managers are ready to try it
- And we would need little help
 - We need a gLite (beta-) as soon as possible, beginning November
 - Installation and configuration of sites must be as simple as possible
 - I.e. do not require root access
 - We expect help from LCG/EGEE to help us configure and maintain the ALICE gLite server, running common services

Phase III – Steps to get started

- Data Management Services
- Input Data
 - They are already registered in the AliEn & LCG Data Catalogues and stored on AliEn & LCG Storage Elements
 - Access the Alien & LCG Catalogues from gLite
 - ... or Translate the AliEn & LCG Catalogues to a gLite Catalogue instance
 - Input Data is scattered on about 30 sites: we need ALL of them to become gLite sites
 - ... or we may do some data movement
- Output Data
 - Must be made available at the User's site for merging and optional registration to the gLite Data Catalogue

Phase III – Steps to get started

- Workload Management Services
 - No special requirement, as the job distribution is intrinsically defined by the input location, but:
 - We need the functionality to split a job into sub-jobs according to the input distribution -- ARDA has it!
 - Jobs submitted by users must be registered to a Master Queue which keeps the record of ALL the ALICE-VO tasks

Conclusion

- Phase I and II of our Data Challenge were completed
 - LCG support and resources were very important
 - LCG middleware has limited the usability of the resources
- Phase III
 - With gLite on the verge to be released we think it would be absurd not to “bite the bullet” and use it now
 - We will provide an experience “complementary” to the component by component strategy of LCG
 - We feel we would gain many months and acquire a precious experience with no special additional load on the deployment team
 - This will help bootstrapping a process which we feel is much too slow and timid
 - And we have already done it with AliEn
- ALICE intends to be gLite-only in the shortest possible time
