A decorative graphic consisting of a thin yellow circle on the left side. A thick yellow horizontal bar extends from the circle towards the right. On the left end of this bar, there is a large black left square bracket. On the right end, there is a large yellow right square bracket.

ALICE Report on the Use of VMC

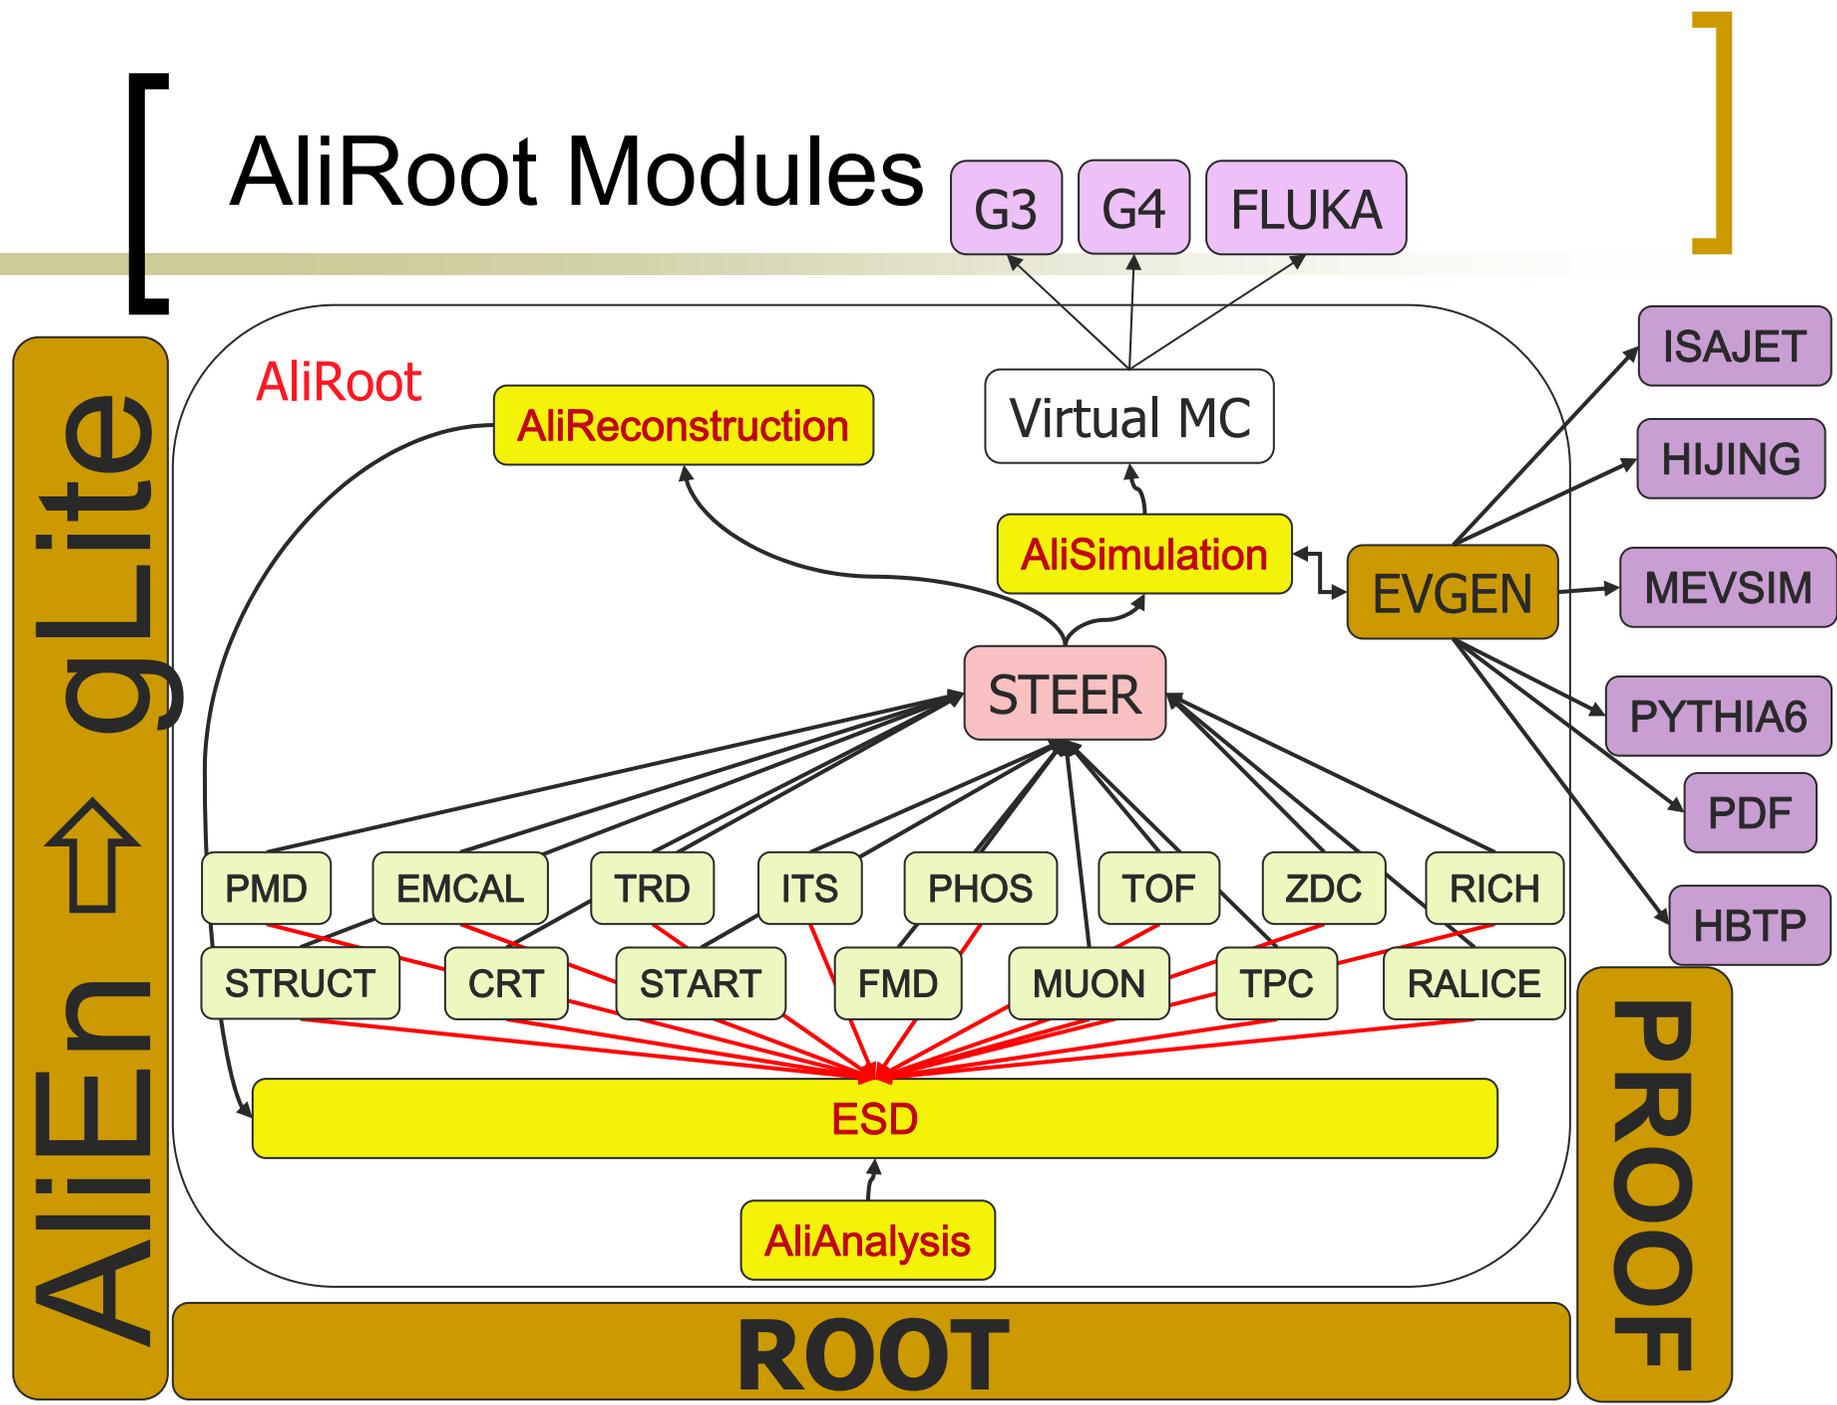

Andreas Morsch
CERN

Virtual MC Workshop
CERN 29/11/2004

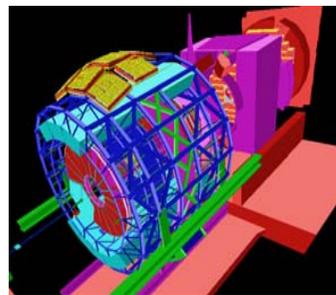

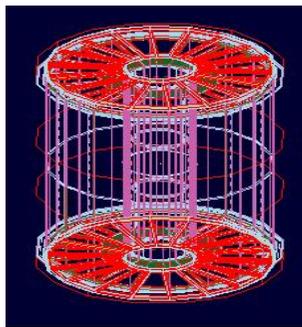

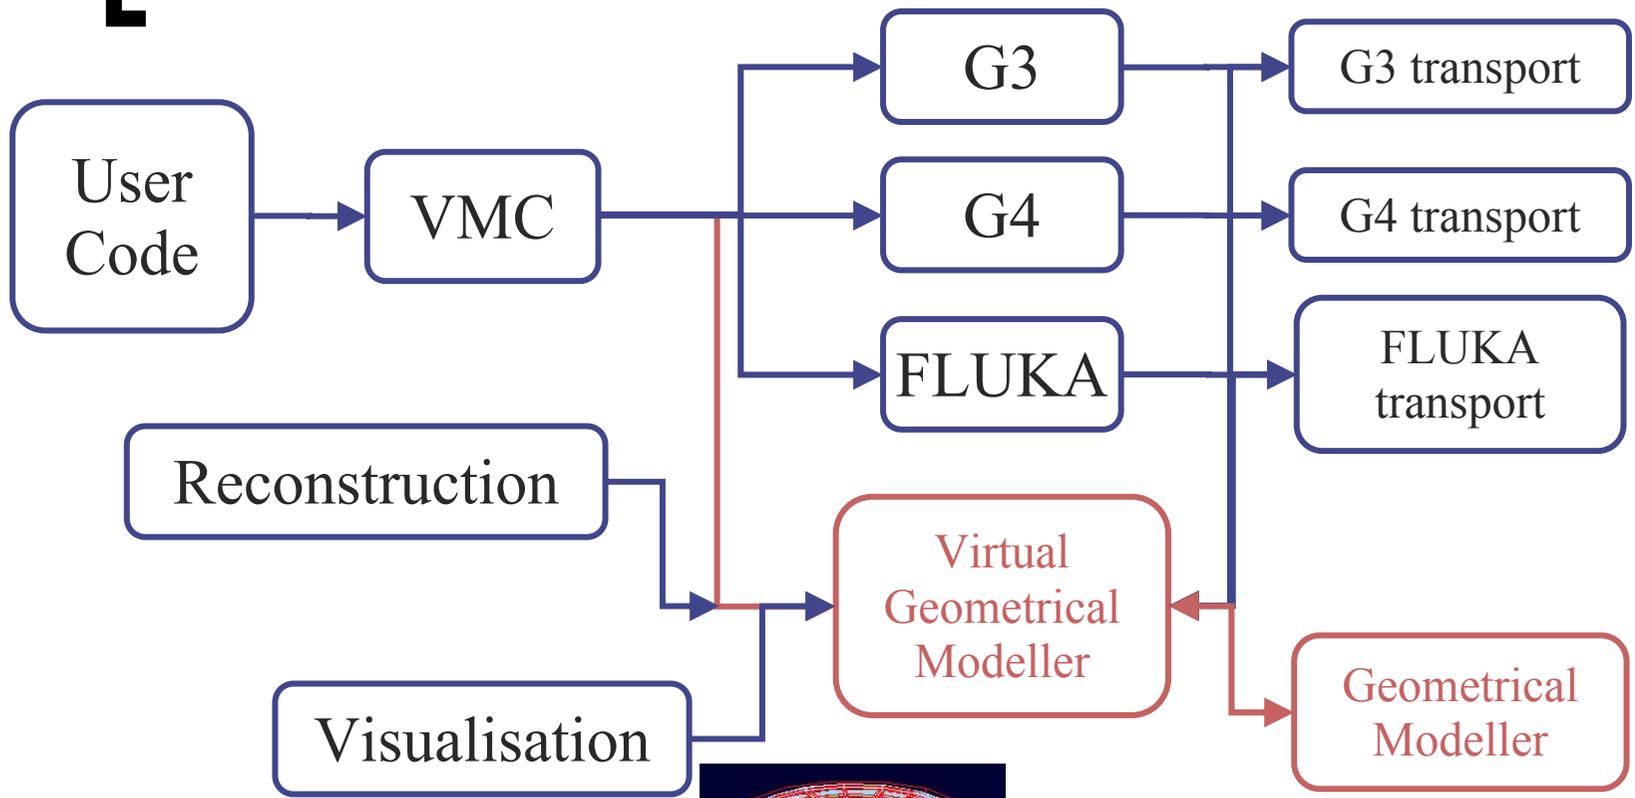

[Introduction]

- The concept of the Virtual Monte Carlo (VMC) has been gradually developed by the ALICE software project
 - First implemented as a specific wrapper to GEANT3, *TGeant3*, to allow smooth migration from FORTRAN based simulation to a C++ framework avoiding the parallel development of two framework.
 - The requirement to reuse the user simulation code when ALICE moves from GEANT3 to FLUKA or GEANT4 based simulation lead to an abstraction of *TGeant3*.
 - Separation of VMC and ALICE specific code allowed to move the interface to ROOT and to make it available to non-ALICE users.
- The ALICE simulation framework is bases on VMC, generator interfaces and ROOT
- ALICE still contributes to VMC. Recently mainly through the implementation of *TFluka*.

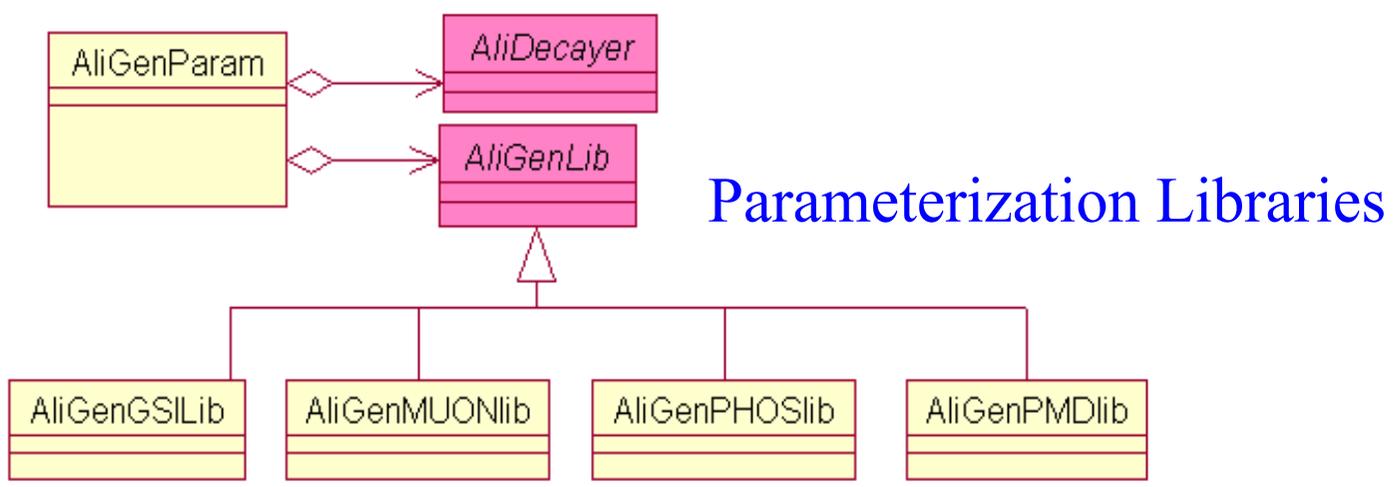

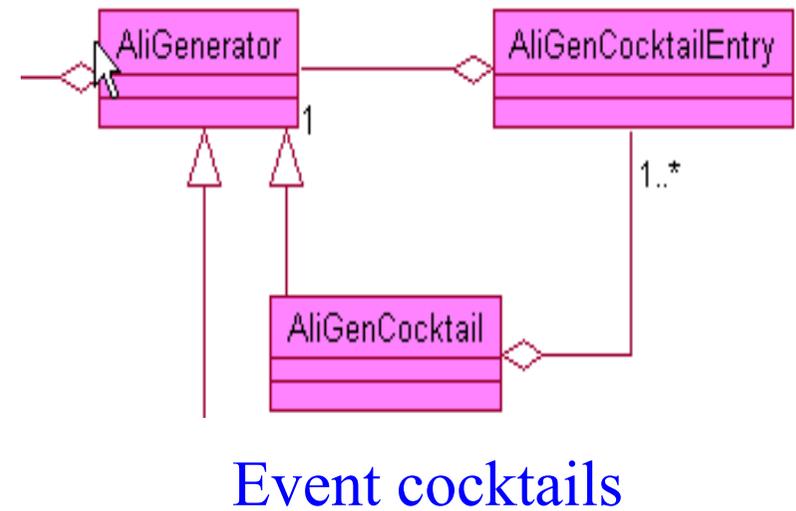

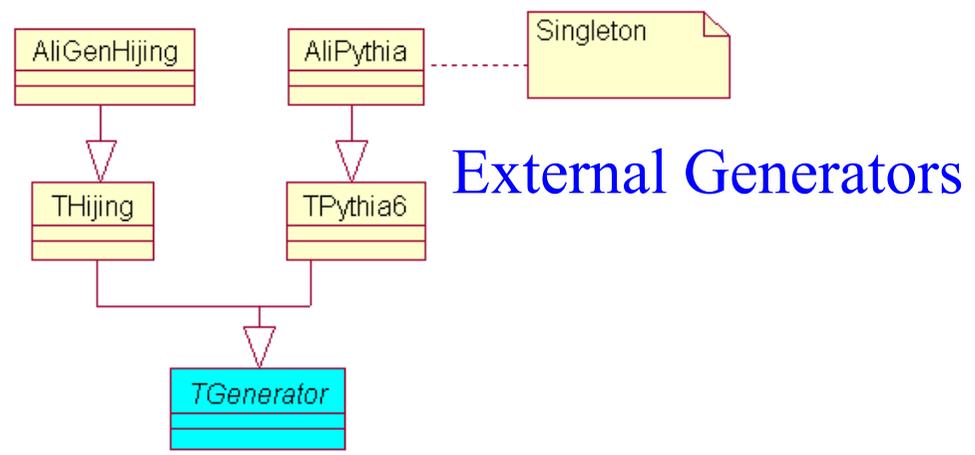

AliRoot Modules

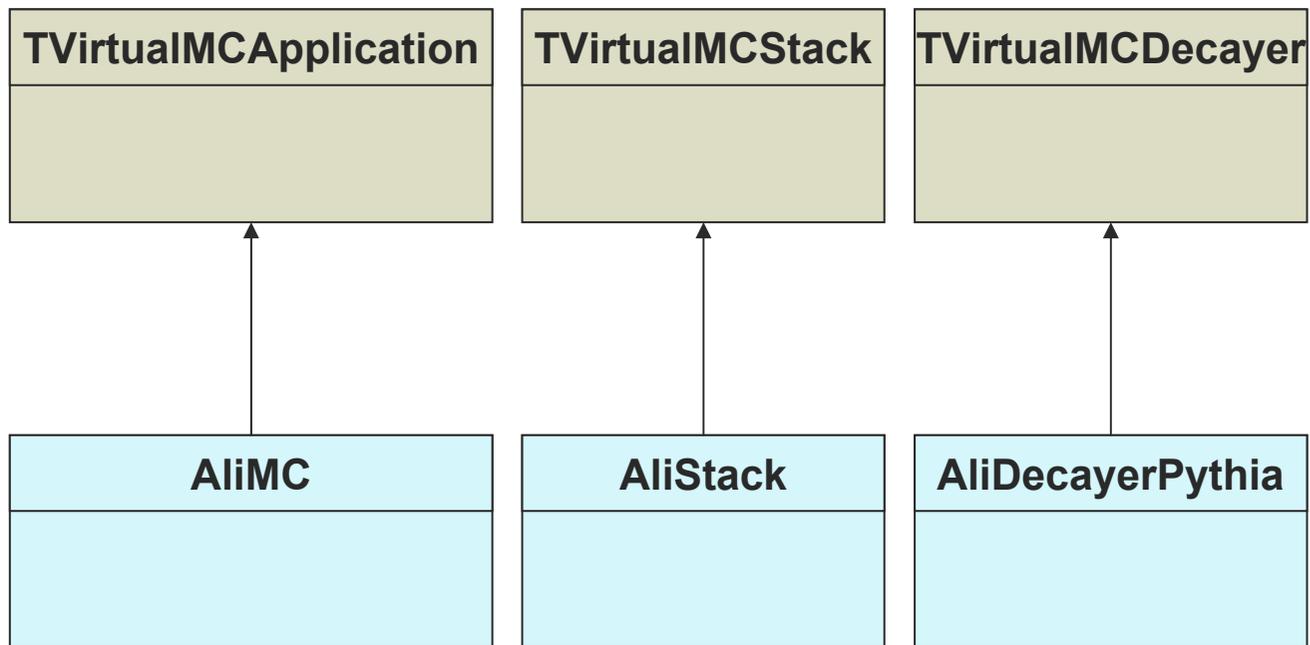

VMC + TGeo

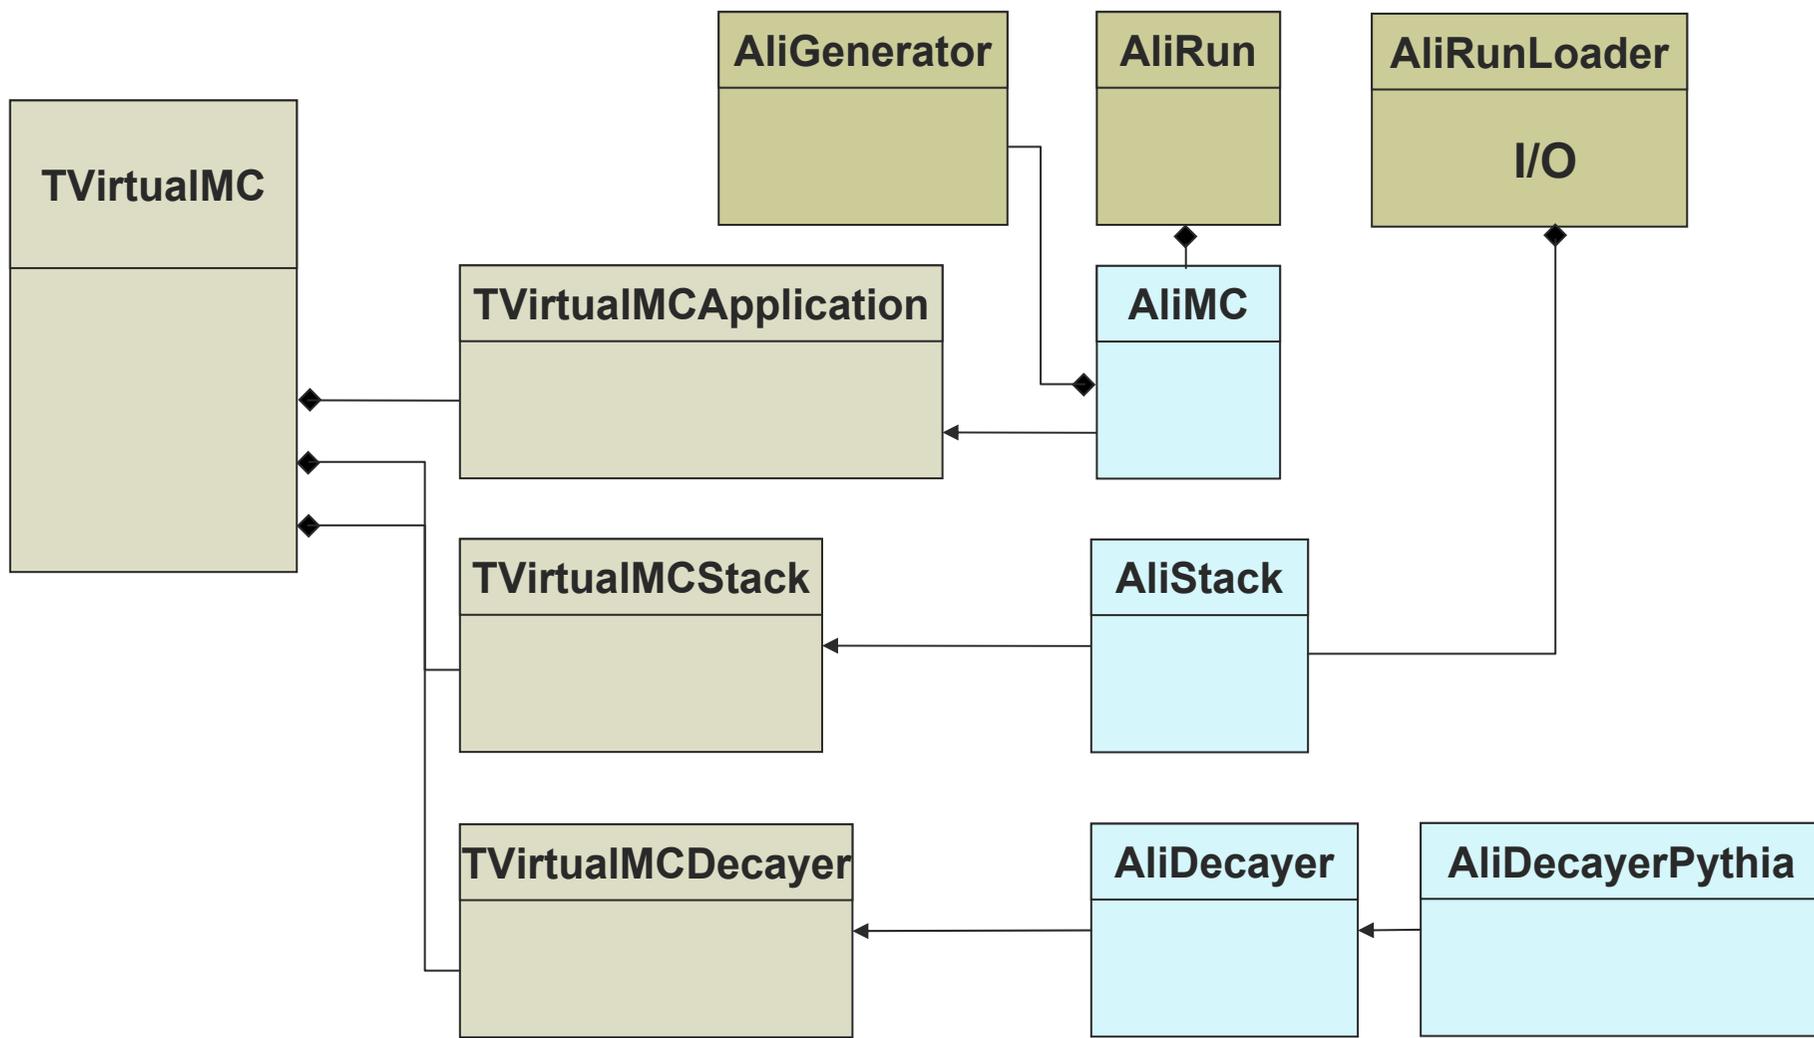

[Event Generator Interfaces]

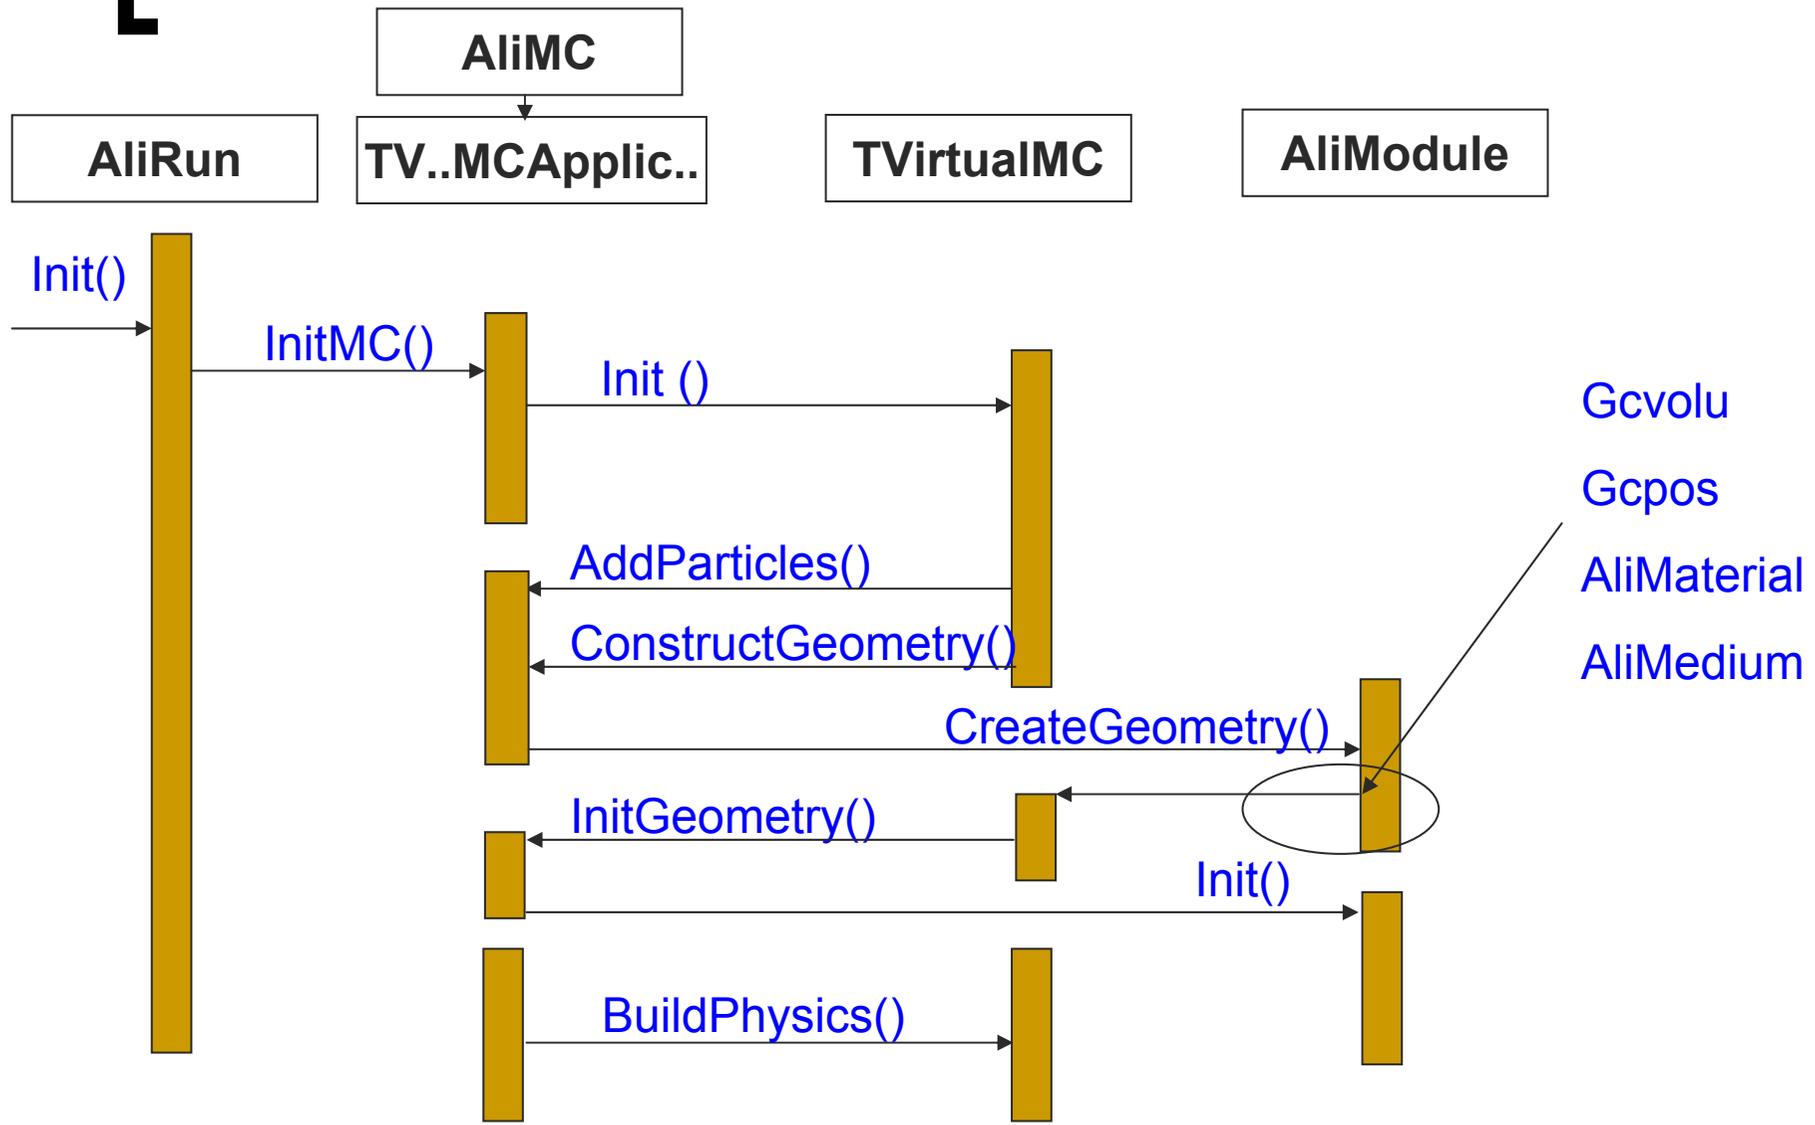

ALICE Specific Implementations of VMC Components

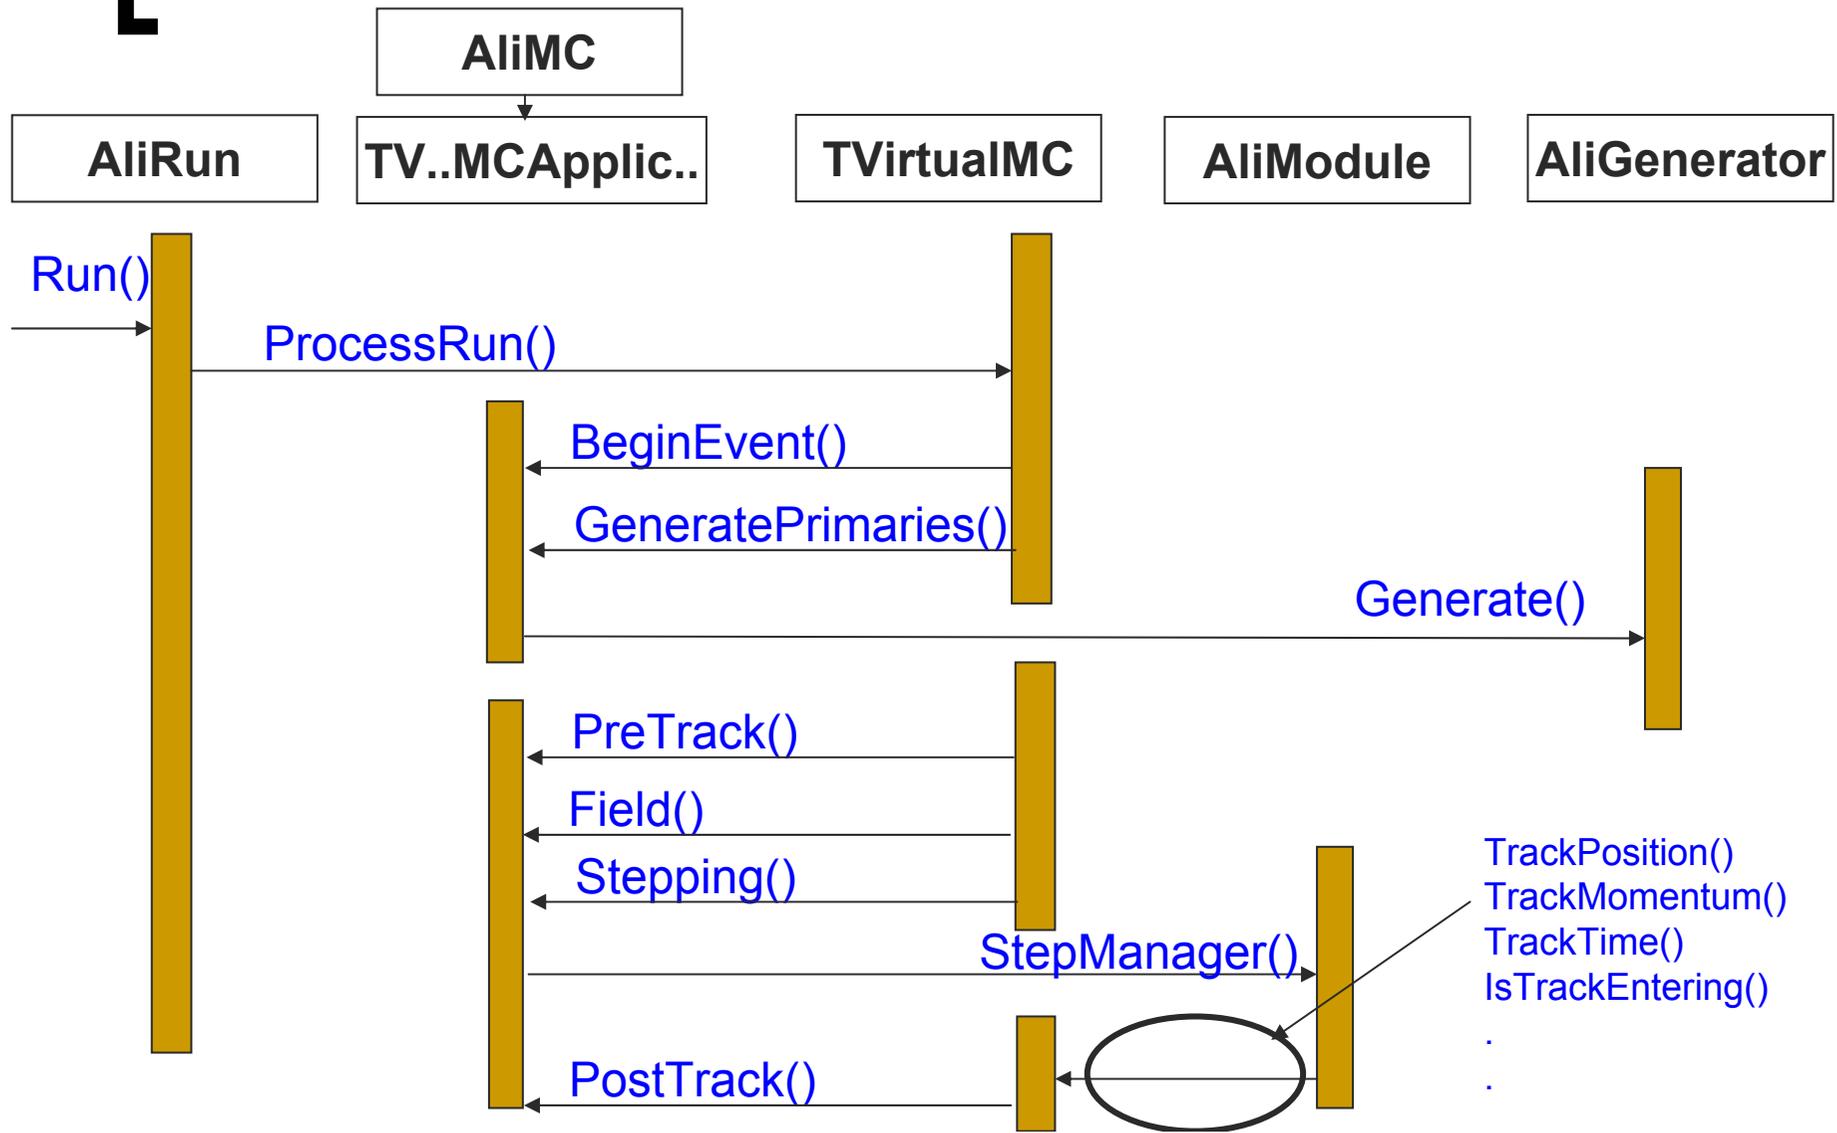

VMC in AliRoot

Initialisation

[Simulation Run]

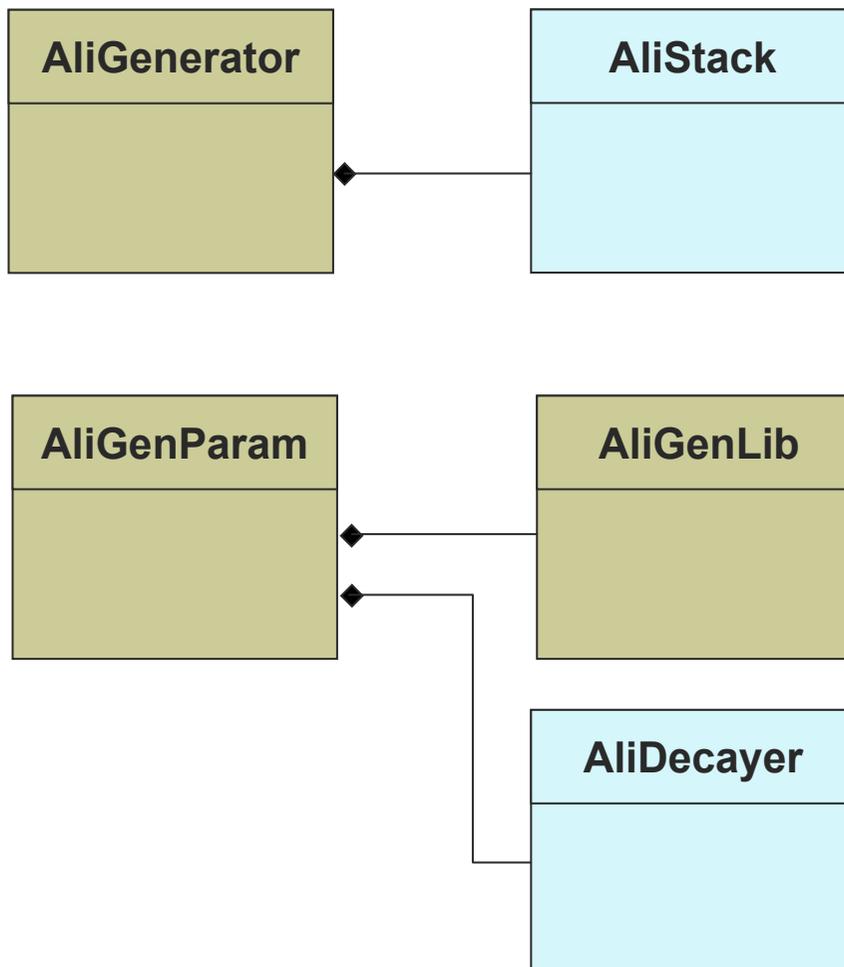

[*AliStack*]

- Implemented as *TClonesArray* of *TParticles*
- Mother-daughter relation via indices
- *PurifyKine()*
 - Keep only particles along direct genealogical line between flagged secondary (e.g. secondary producing hit) and primary particle.
- *ReorderKine()*
 - Reorder daughter particles of the same mother into continuous sequence. Needed for TFluka.

[*AliMCDecayerPythia*]

- Implemented using Pythia6 routine `py1ent`
 - Possibility to force certain predefined decay-modes
 - `dimuon`
 - `smilileptonic`
 - `D->Kπ`
- Used by
 - *TGeant3* for decays of particles with finite lifetime but unknown decay modes
 - Generators like *AliGenParam* to decay short-lived resonances

VMC components and Generators

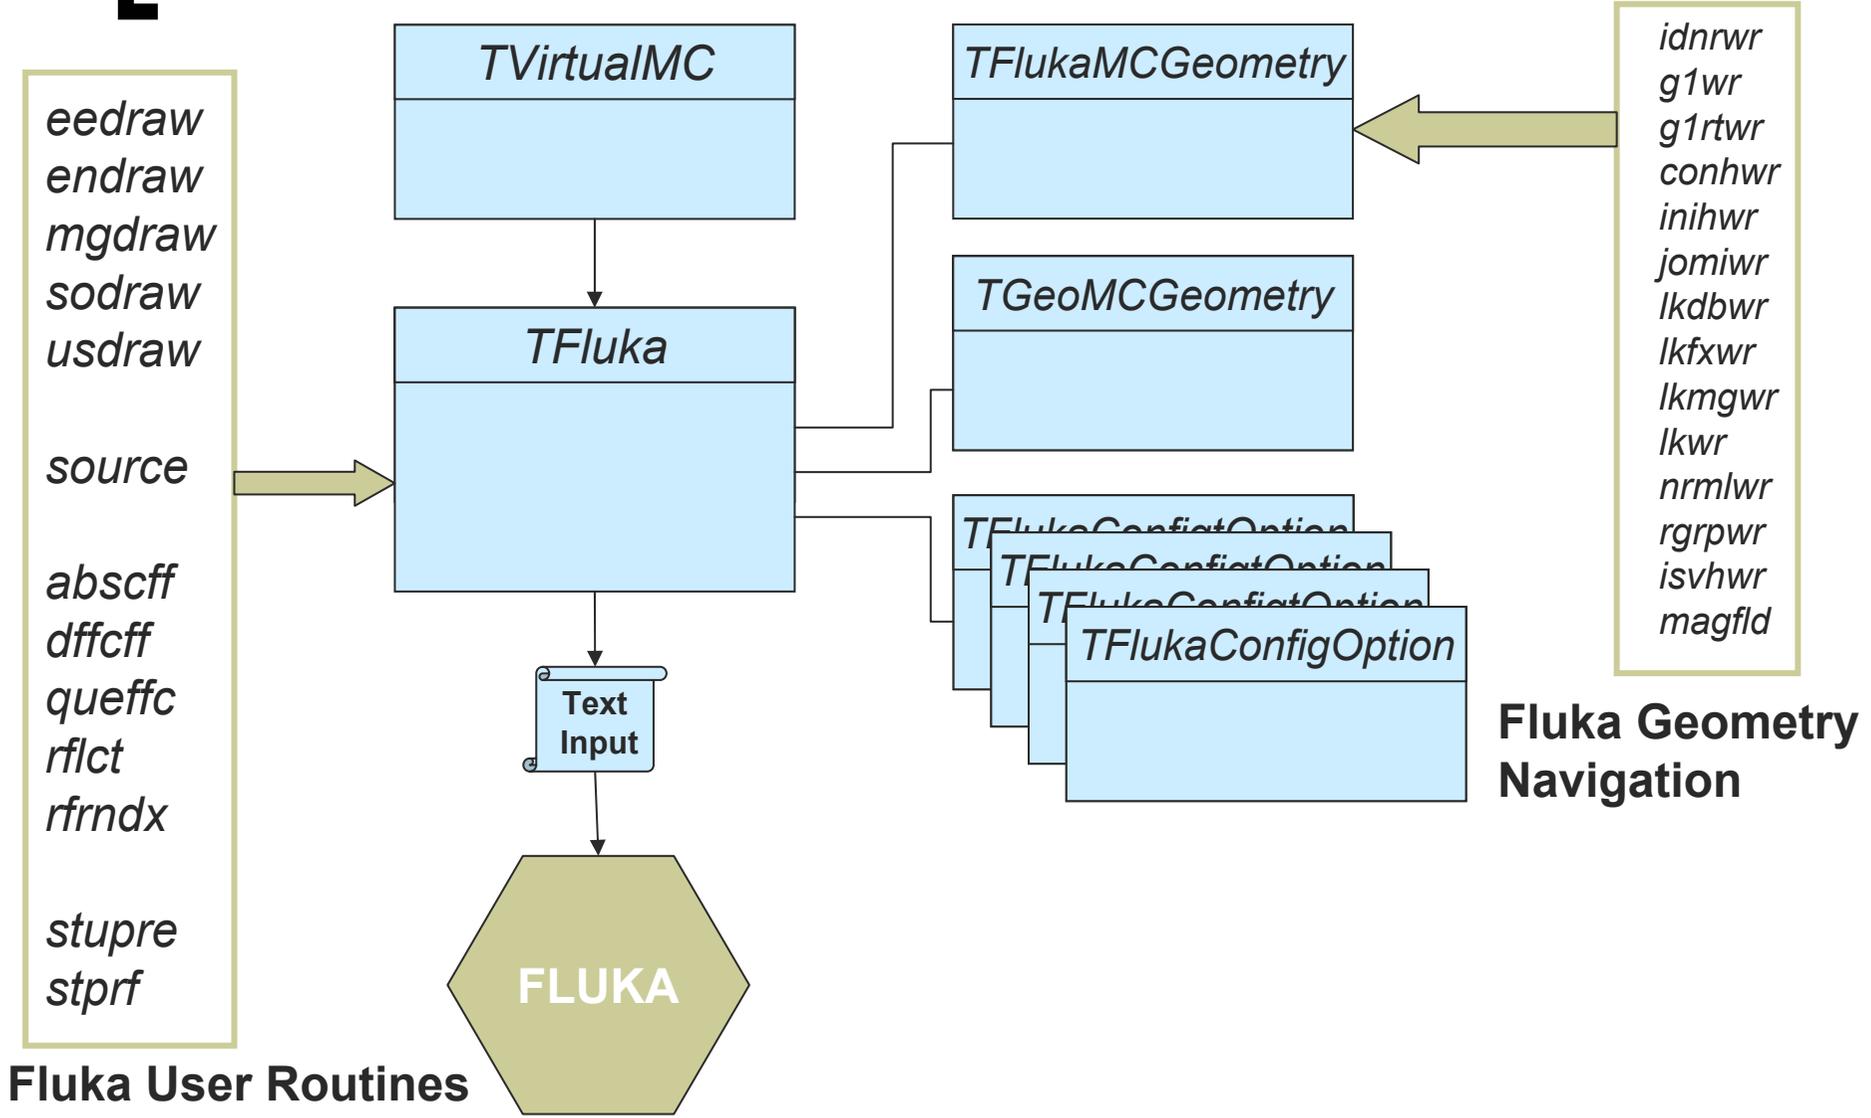

[Run Time Configuration]

```
{  
new TGeant3("C++ Interface to Geant3");  
TVirtualMCDecayer *decayer = new AliDecayerPythia();  
decayer->SetForceDecay(kAll); decayer->Init();  
gMC->SetExternalDecayer(decayer);  
gMC->SetProcess("DCAY",1);  
gMC->SetProcess("PAIR",1);  
gMC->SetProcess("COMP",1);  
gMC->SetProcess("PHOT",1);  
.  
.  
.
```

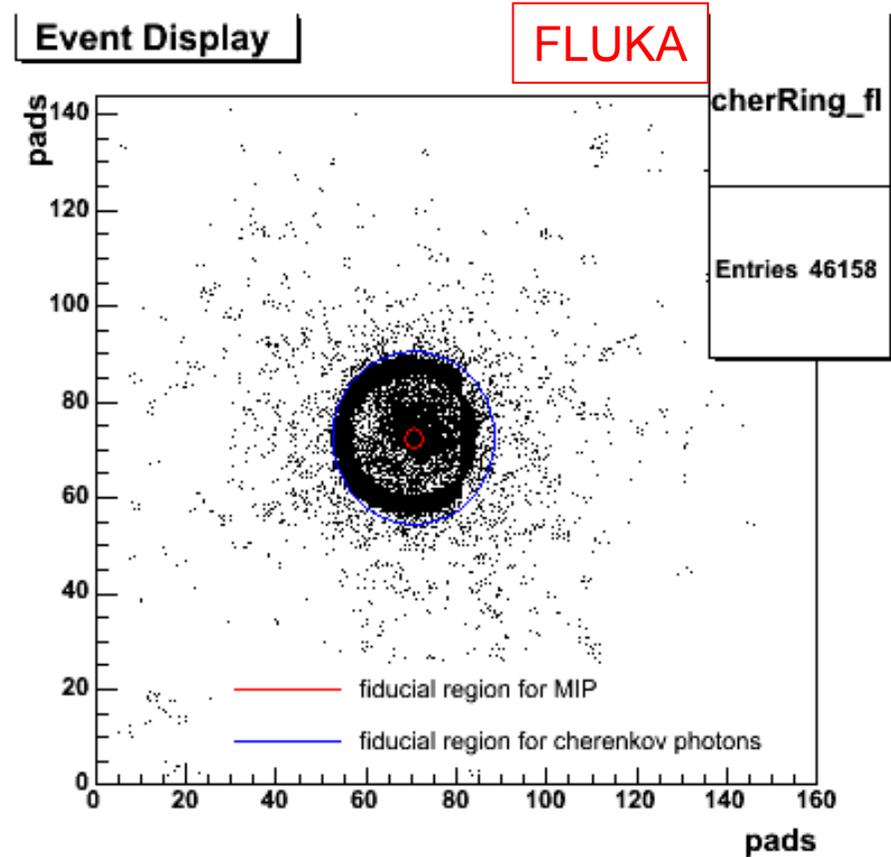

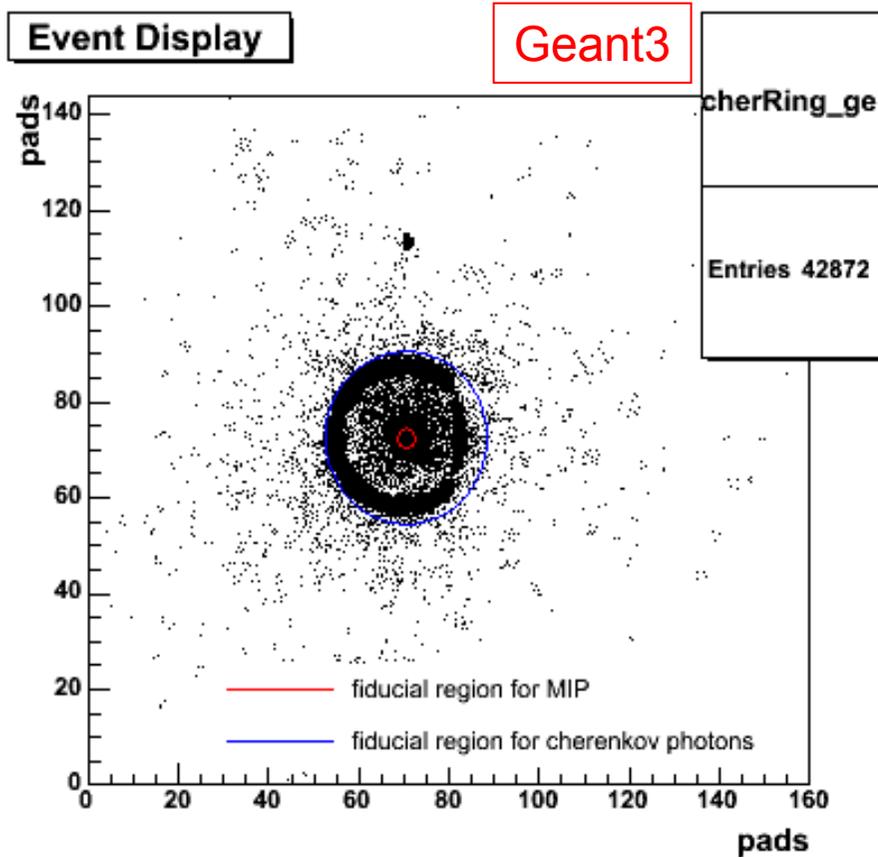

Virtual Monte Carlo: Status and Plans

- TGeant3
 - Used in production
- TGeant4
 - Used for Geant4 physics validation
- TFluka
 - Implemented
 - Testing ongoing (in collaboration with Cuban institute (CEADEN))
 - Next PDC with TFluka

[TFluka Implementation]

[HMPID: 5 GeV Pions]
