

**gg→H for different MC's:  
uncertainties due to jet veto, update**

**Giovanna Davatz, ETH Zurich**

# Outline

- **Short summary of last meeting's results**
- **Jet energy smearing : get new uncertainty**
- **New CASCADE version: results**
- **Outlook**

# Where we left off

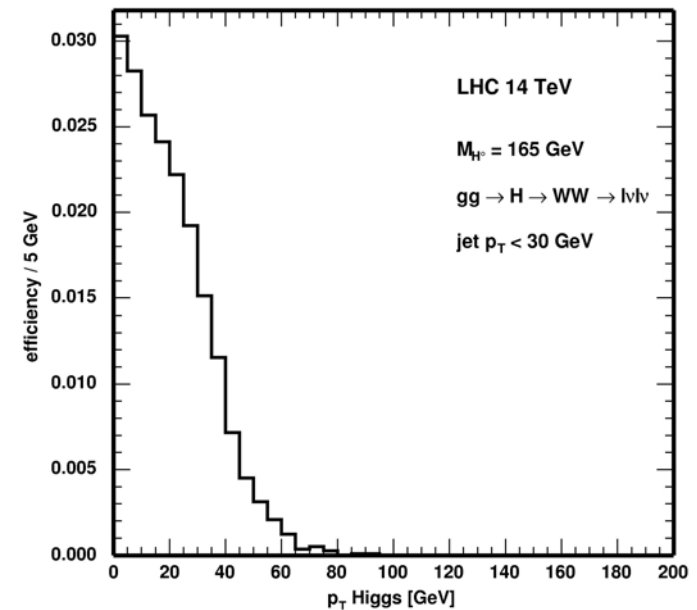

## Comparing PYTHIA 6.225, HERWIG 6.505 and MCatNLO 2.31

without underlying events

- The total efficiencies for HERWIG, MCatNLO and PYTHIA vary by  $\sim 5\%$

	$\epsilon$
<b>PYTHIA</b>	<b>0.62</b>
<b>HERWIG</b>	<b>0.63</b>
<b>MCatNLO</b>	<b>0.59</b>

- In the region of interest for the  $gg \rightarrow H \rightarrow WW \rightarrow l\nu l\nu$  signal selection, the difference is even smaller

→ for the region where  $p_T^H < 80$  GeV,  
the 3 MCs vary even less

	$\epsilon$ for $p_T^H < 80$ GeV
<b>PYTHIA</b>	<b>0.72</b>
<b>HERWIG</b>	<b>0.70</b>
<b>MCatNLO</b>	<b>0.69</b>

- Including higher order corrections (by reweighting) leads to about same efficiency uncertainty as the leading order case

	$\epsilon$	$\epsilon$ reweighted
<b>PYTHIA</b>	<b>0.62</b>	<b>0.56</b>
<b>HERWIG</b>	<b>0.63</b>	<b>0.60</b>
<b>MCatNLO</b>	<b>0.59</b>	<b>0.57</b>

- Including Matrix Element corrections for  $gg \rightarrow H$  in HERWIG leads to an overall efficiency of 0.55 (0.63 without ME corrections), and 0.67 instead of 0.70 for region where  $p_T^H < 80$  GeV

## Including underlying events:

- **The different PYTHIA tunings for the underlying events lead to about the same efficiency**
- **The difference in the efficiency between PYTHIA with and without underlying events is smaller than 1%**

proceeding: compare new Monte Carlo versions

**New versions for HERWIG(6.506) and PYTHIA(6.227):**

**Matrix Element correction not yet included in new HERWIG version,  
PYTHIA now per default Rick's Tune A for underlying events**

**Without underlying events: very small difference in efficiency between  
old and new versions ( $\approx 0.01$ )**

**With underlying events differences for PYTHIA already shown last time**

# Efficiency after smearing

Get realistic CMS efficiency for jet veto with smeared Jet Et:

jet resolution:  $\Delta E_T / E_T = 118\% / \text{sqrt}(E_T) + 7\%$

	$\epsilon$	$\epsilon$ smeared
<b>PYTHIA</b>	<b>0.61</b>	<b>0.61</b>
<b>HERWIG</b>	<b>0.62</b>	<b>0.61</b>
<b>MCatNLO</b>	<b>0.59</b>	<b>0.58</b>

$p_T^H < 80 \text{ GeV}$	$\epsilon$	$\epsilon$ smeared
<b>PYTHIA</b>	<b>0.72</b>	<b>0.72</b>
<b>HERWIG</b>	<b>0.70</b>	<b>0.70</b>
<b>MCatNLO</b>	<b>0.69</b>	<b>0.69</b>

# Efficiency after smearing

Smearing: tendency to lower efficiency,  
as can be expected:

there are more jets at low pt than high pt

→ smearing: more jets which had pt below 30 GeV now have pt above 30 GeV  
than vice versa

→ jet veto should affect more events after smearing

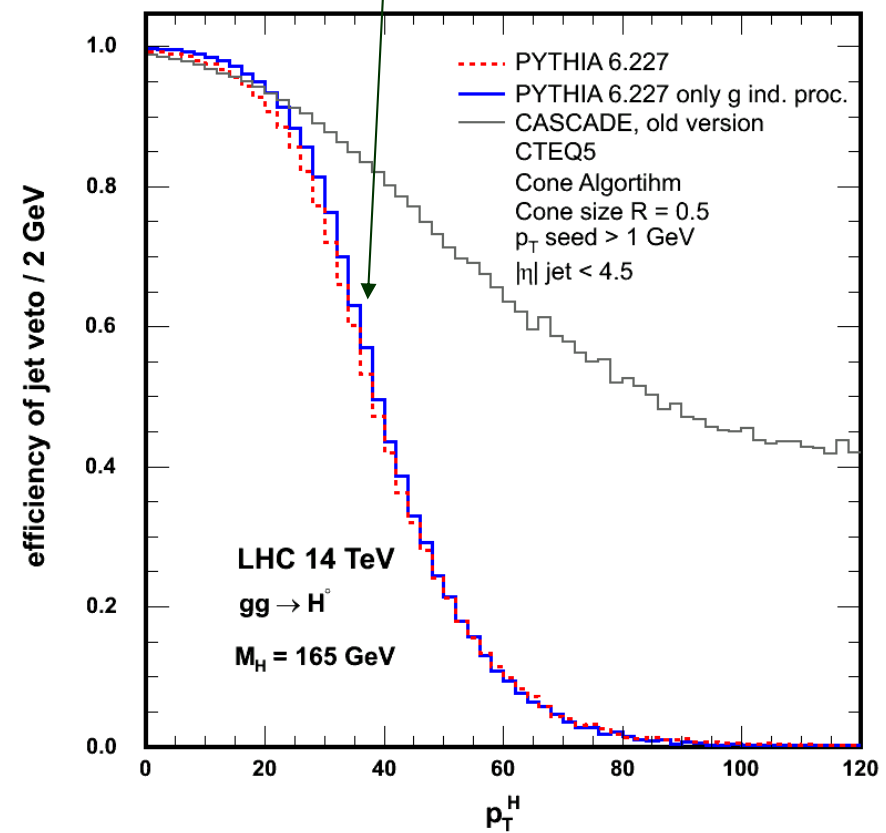

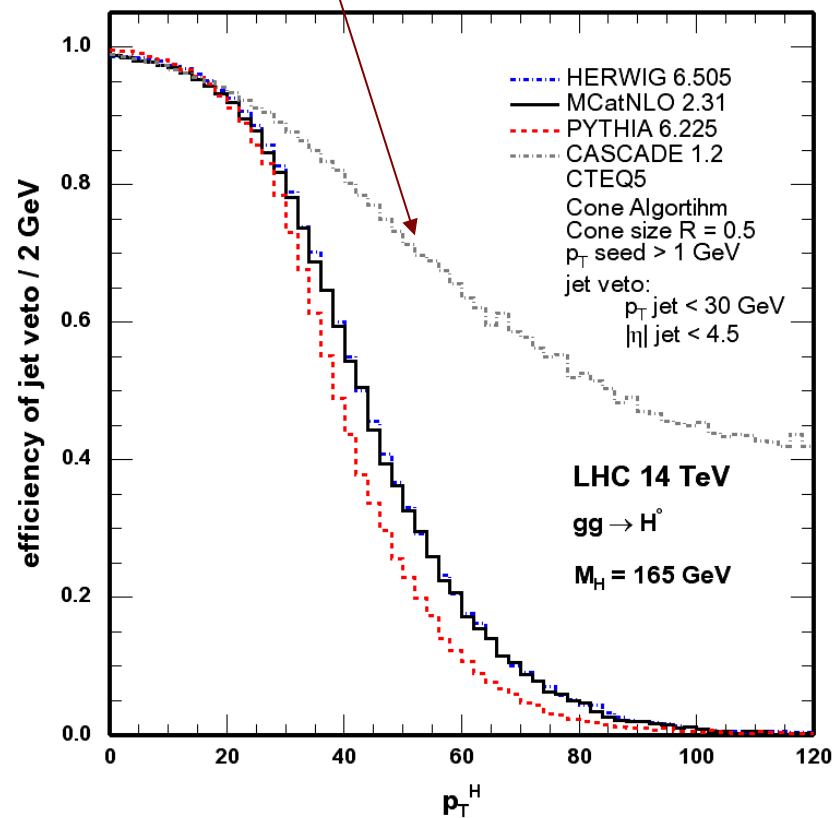

but: effect very small

# New CASCADE version

Was different shape of CASCADE due to purely gluon induced processes?

→ simulation with PYTHIA, purely gluon induced processes generated

There was a bug in CASCADE, new version released

# CASCADE 1.2007

	$\epsilon$
<b>PYTHIA</b>	<b>0.61</b>
<b>HERWIG</b>	<b>0.62</b>
<b>MCatNLO</b>	<b>0.59</b>
<b>CASCADE</b>	<b>0.59</b>

$p_T^H < 80 \text{ GeV}$	$\epsilon$
<b>PYTHIA</b>	<b>0.72</b>
<b>HERWIG</b>	<b>0.70</b>
<b>MCatNLO</b>	<b>0.69</b>
<b>CASCADE</b>	<b>0.68</b>

difference per bin is still too big, needs further investigation!

## Conclusion and Outlook

- **Smearing jet  $E_T$  does not affect uncertainty between PYTHIA, HERWIG and MCatNLO much**
  - **don't expect much difference in ORCA simulation!**
- **Will run ORCA to see how much the uncertainty will be after full detector simulation**
- **Study with CASCADE needs further improvements**

Special thanks to A.Nikitenko
