Alexander Sherstnev (MSU)
Bobby Scurlock (UF)

## Outline

$\triangleright$ Introduction
$\triangleright$ Parameter space
$\triangleright$ References
$\triangleright$ Tools
$\triangleright$ Backgrounds considered
$\triangleright$ Signal points
$\triangleright$ Cut variables selection
$\triangleright$ Cuts "optimization"
$\triangleright$ Selected cut sets
$\triangleright$ Results: significance, sensitive area
$\triangleright$ Results: stability
$\triangleright$ Summary and Prospects
Note: all the results shown here approved by CMS in June'04. A few comments on current work will be given in "Prospects"

## mSUGRA $\left(\mathrm{m}_{0}, \mathrm{~m}_{1 / 2}\right)$ plane

$\tan \beta=10, \mu>0$

mSUGRA - GUT sub-model of MSSM - is a popular simplification $\triangleright$ only 5 parameters $\left(\mathrm{m}_{0}, \mathrm{~m}_{1 / 2}, \tan \beta, \mathrm{~A}_{0}\right.$, sign $\left.\mu\right)$

## STISV noints considered in this study

|  | m 12 | m 0 | $\tan \beta$ |
| :---: | ---: | ---: | ---: |
| 1 | 500 | 107 | 10 |
| $2^{*}$ | 300 | 1330 | 10 |
| 3 | 700 | 149 | 10 |
| 4 | 210 | 150 | 10 |
| 5 | 850 | 181 | 10 |
| 6 | 285 | 210 | 10 |
| 7 | 700 | 2155 | 10 |
| 8 | 360 | 230 | 10 |
| 9 | 900 | 2530 | 10 |
| 10 | 240 | 330 | 20 |
| 11 | 400 | 85 | 10 |
| 12 | 300 | 1200 | 35 |
| 13 | 500 | 1620 | 35 |
| 14 | 1000 | 2520 | 35 |
| 15 | 1000 | 2715 | 10 |
| $16^{*}$ | 1500 | 3442 | 10 |
| 17 | 2000 | 4192 | 10 |
| 18 | 2500 | 4942 | 10 |
| 19 | 250 | 60 | 10 |
| 20 | 300 | 65 | 10 |

## Signature choice

$\triangleright$ For this study the "2 Same Sign Muons" signature was chosen
$\triangleright$ theoretical studies for Tevatron
$\triangleright$ hep-ph/9904282, "Supersymmetry Reach of the Tevatron via Trilepton, Like-Sign Dilepton and Dilepton plus Tau Jet Signatures", K.T.Matchev, D.M.Pierce
$\triangleright$ experimental studies at Tevatron
$\triangleright$ see e.g. theses by M.Worcester and A.Yurkewicz
$\triangleright$ simple and clear trigger objects
$\triangleright$ reduced number of background events/processes in comparison to "multi-jets only" signatures

## Luminosity

$\triangleright$ In this study all calculations are done for the integral luminosity of $10 \mathrm{fb}^{-1}$

## Tools

$\triangleright$ To calculate coupling constants, cross sections for SUSY processes: ISAJET
$\triangleright$ http://www.phy.bnl.gov/~isajet/
$\triangleright$ To calculate NLO corrections for SUSY processes: PROSPINO
$\triangleright$ hep-ph/9611232
$\triangleright$ For event generation: CompHEP $\left(Z / \gamma^{*} b B\right.$, Singletop processes), PYTHIA (SUSY, tt, ZZ, ZW, WW)
$\triangleright$ hep-ph/9908288 (CompHEP)
$\triangleright$ http://www.thep.lu.se/~torbjorn/Pythia.html
$\triangleright$ Full CMS detector simulation was used in this study: CMSIM, ORCA
$\triangleright$ http://cmsdoc.cern.ch/cmsim/cmsim.html
$\triangleright$ http://cmsdoc.cern.ch/cmsreco/

Cross sections, event numbers: SM processes

## - excluded points

## $\triangleright$ Notations:

$\triangleright$ N1 - total number of expected events for integral luminosity of $10 \mathrm{fb}^{-1}$
$\triangleright$ N2 - number of events after pre-selection (two same sign muons, $\mathrm{P}_{\mathrm{T}}>10 \mathrm{GeV}$ )
$\triangleright$ Significance, $S_{12}=2\left(\sqrt{N_{S}+N_{B}}-\sqrt{N_{B}}\right) \quad$ (S.I.Bityukov,N.V.Krasniov)
$\triangleright$ S/B - ratio: $N_{S} / N_{B}$

## Diagram examples

$\triangleright$ Signal...
Background...

$\triangleright$ Variables for cuts:
$\triangleright$ Missing $\mathrm{E}_{\mathrm{T}}$
$\triangleright$ Jets $\mathrm{E}_{\mathrm{T}}$
$\triangleright$ Muon $\mathrm{P}_{\mathrm{T}}$, Muon Impact Parameter
$\triangleright$ Plus: Muon Isolation, Muon $\eta$, Jet $\eta$, number of jets/muons, ...

Event kinematics: SM vs. SUSY, example

## Analysis cuts

$\triangleright$ For chosen cut variables, several values for optimization were chosen:
$\triangleright$ Missing $\mathrm{E}_{\mathrm{T}}: 0,100,150,200,250,400,500 \mathrm{GeV}$
$\triangleright \mathrm{E}_{\mathrm{T}} \mathrm{jet}_{1}: 0,70,100,200,300,400 \mathrm{GeV}$
$\triangleright \mathrm{E}_{\mathrm{T}} \mathrm{jet}_{3}: 0,30,50,80,100,170,250 \mathrm{GeV}$
$\triangleright \mathrm{P}_{\mathrm{T}} \mathrm{\mu}_{1}: 10,20,30,60,100,150 \mathrm{GeV} / \mathrm{c}$
$\triangleright \mathrm{P}_{\mathrm{T}} \mu_{2}: 10,15,20,50,80 \mathrm{GeV} / \mathrm{c}$
$\triangleright I P \mu_{\min }: N / A, 0.005,0.0015,0.0005 \mathrm{~cm}$
$\triangleright I P \mu_{\text {max }}: N / A, 0.1,0.03,0.01,0.005 \mathrm{~cm}$
$\triangleright$ For each cuts set (Missing $\mathrm{E}_{\mathrm{T}}, \mathrm{E}_{\mathrm{T}} \mathrm{jet}_{1}, \mathrm{E}_{\mathrm{T}} \mathrm{jet}_{3}, \mathrm{P}_{\mathrm{T}} \mathrm{\mu}_{1}$, $\left.\mathrm{P}_{\mathrm{T}} \mu_{2}, I P \mu_{\text {min }}, I P \mu_{\max }\right)$
$\triangleright$ Values of Significance, S/B and expected event numbers ( $\mathrm{N}_{\text {Final }}$ ) for $10 \mathrm{fb}^{-1}$ calculated
$\triangleright$ about 176,000 cut sets used
$\triangleright$ Choice of final sets "optimized"

## Final set choice "optimization": example

$\triangleright$ Plot Significance for all sets of cuts...
$\triangleright$ Then choose an "optimal" region: several iterations...
$\triangleright$ Finally, choose a particular set...

| Sign | Significance vs. cuts set number | nber |
| :---: | :---: | :---: |
|  |  |  |
| April '05 | Alexey Drozdetskiy, University of Florida, CMS | 12 |

## Analysis cuts

$\triangleright$ Chosen sets (in addition to the "signature cut": $\mathrm{P}_{\mathrm{T}}$ of both same sign $\mu>10 \mathrm{GeV}$ ):
$\triangleright$ Set \#1:
$\triangleright$ Missing $\mathrm{E}_{\mathrm{T}}>200 \mathrm{GeV}$,
$\triangleright \mathrm{E}_{\mathrm{T}} \mathrm{jet}_{3}>170 \mathrm{GeV}$,
$\triangleright \mathrm{P}_{\mathrm{T}} \mu_{1}>20 \mathrm{GeV}$
$\triangleright$ Set \#2:
$\triangleright$ Missing $\mathrm{E}_{\mathrm{T}}>100 \mathrm{GeV}$,
$\triangleright \mathrm{E}_{\mathrm{T}} \mathrm{jet}_{1}>300 \mathrm{GeV}$,
$\triangleright \mathrm{E}_{\mathrm{T}} \mathrm{jet}_{3}>100 \mathrm{GeV}$
$\triangleright$ All of the following results were done for these two sets

## Results (example): cut set \#2

| SET 2 | SM | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| N final | $432 \pm 8.8$ | $184 \pm 9.3$ | $560 \pm 29$ | $30.4 \pm 1.4$ | $1590 \pm 152$ | $9.6 \pm 0.45$ | $1030 \pm 67$ |

| Signif | 0.4 | 20.5 | $\mathrm{n} / \mathrm{a}$ | 56.1 | 13.4 | 28.1 | 4 |
| S/B | 0.019 | 1.2 | $\mathrm{n} / \mathrm{a}$ | 4.5 | 0.75 | 1.8 | 0.2 |
| SET 2 | $\mathbf{1 4}$ | 15 | $\mathbf{1 6}$ | $\mathbf{1 7}$ | $\mathbf{1 8}$ | 19 | $\mathbf{2 0}$ |
| N final | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $1220 \pm 106$ | $996 \pm 67$ |
| Signif | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | 39.8 | 34 |
| S/B | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | 2.8 | 2.3 |

Monte Carlo statistical errors shown for number of events after all cuts ( N final)

All final events accepted by L1 and HLT.
$\triangleright \mathrm{L} 1$ : single $\mu$ with $\mathrm{P}_{\mathrm{T}}>14 \mathrm{GeV}$, di- $\mu$ with $\mathrm{P}_{\mathrm{T}}>3 \mathrm{GeV}$
$\triangleright$ HLT: di- $\mu$ with $\mathrm{P}_{\mathrm{T}}>7 \mathrm{GeV}$

## Results: significance

$\triangleright$ Number of points out of reach for $10 \mathrm{fb}^{-1}$ for two cut sets varies: 910
$\triangleright$ Significance < 5
$\triangleright$ Potential "discovery points" for $10 \mathrm{fb}^{-1}$
$\triangleright$ Significance > 5
$\triangleright$ in addition for those points
$\triangleright$ S/B > 0.4 (a 40\% excess of events or more over expected number of the SM events)

|  | Significance |  |
| :--- | :---: | :---: |
|  | SET 1 | SET 2 |
| 1 | 9.05 | 8.06 |
| 2 | 20.8 | 21.4 |
| 3 | 2 | 1.44 |
| 4 | 25 | 48.4 |
| 5 | 0.77 | 0.46 |
| 6 | 20.6 | 35 |
| 7 | 0.78 | 0.4 |
| 8 | 15.5 | 20.5 |
| 9 | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ |
| 10 | 31.7 | 56.1 |
| 11 | 12.1 | 13.4 |
| 12 | 27.1 | 28.1 |
| 13 | 6 | 4 |
| 14 | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ |
| 15 | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ |
| 16 | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ |
| 17 | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ |
| 18 | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ |
| 19 | 25.6 | 39.8 |
| 20 | 20.6 | 34 |

## Results: sensitive area at $10 \mathrm{fb}^{-1}$

$\triangleright$ Many points will be visible with $\int \mathrm{L} \ll 10 \mathrm{fb}^{-1}$
$\triangleright$ Significance for many points >> 5 for $\int \mathrm{L}=10 \mathrm{fb}^{-1}$

## First estimate of systematic effects (preliminary)

$\triangleright$ To estimate stability of the results, a variation has been made:
$\triangleright+30 \%$ SM events AND -30\% SUSY events at the same time
$\triangleright$ only one background process survive after final cuts: $t \bar{t}$
$\triangleright$ expected precision of measuring its cross section (including theoretical systematic) is about $10 \%$
$\triangleright+20 \%$ (and $-20 \%$ ) shift in cut values simultaneously was tried
$\triangleright$ Only one "SUSY discovery" point (\#13) goes out of reach

## Summary

$\triangleright$ mSUGRA model was used for the study
$\triangleright \tan \beta=10, \operatorname{sign}(\mu)>0, A_{0}=0$
$\triangleright$ Many benchmark points are in sensitive area for $\mathrm{L} \lll 1 \mathrm{Ofb}^{-1}$
$\triangleright$ up to 600 GeV in $\mathrm{m}_{1 / 2}$ and at least up to 1600 GeV in $m_{0}$
$\triangleright$ Full detailed simulation, trigger emulation and reconstruction was used
$\triangleright$ Results are optimistic for SUSY discovery

## Prospects (work in progress)

$\triangleright$ We plan to do further optimization
$\triangleright$ other cut variables may be used for S/B and Significance optimization, e.g.:
$\triangleright \mu$ isolation
$\triangleright$ b-tagging
$\triangleright \eta$ of jets, $\eta$ of muons
$\triangleright$ Other backgrounds to consider
$\triangleright$ QCD multi-jet production (including fake muons contribution)
$\triangleright$ Extend $\mu$-acceptance in off-line reconstruction up to 2.4 (now used up to 2.1)
$\triangleright$ about $30 \%$ more signal events
$\triangleright$ Systematic effects will be addressed in details and included into the significance calculation
$\triangleright$ More sophisticated optimization algorithm (like genetic one) may be used for optimization
$\triangleright$ Other SUSY point (and models) may be studied

## Thanks

$\triangleright$ Andreas Birkedal (Cornell)
$\triangleright$ Nancy Marinelli (University of Athens)
$\triangleright$ Konstantin Matchev (UF)
$\triangleright$ Luc Pape (CERN)
$\triangleright$ Albert de Roeck (CERN)
$\triangleright$ Michael Spira (PSI)
$\triangleright$ Maria Spiropulu (CERN)
$\triangleright$ Grzegorz Wrochna (Soltan Institute for Nuclear Studies)

## ADDENDUM

## Analysis scheme

## Tools

Generators: $\sigma$ (LO/NLO), coupling constants, matrix elements
Generators: showering, event development
Full detector simulation
Trigger emulation
Full events reconstruction
Analysis: optimization of significance and $\mathrm{N}_{\mathrm{S}} / \mathrm{N}_{\mathrm{B}}$
$\rightarrow$ variables for cuts choice
$\rightarrow$ cuts optimization
results, error analysis (stat. \& system.)

## Technical details: generators

$\triangleright$ From PYTHIA 6.2 manual: "ISASUSY... provides a more precise solution..." than possible option for mSUGRA in PYTHIA
$\triangleright$ ISAJET $7.69+$ PYTHIA $6.220 \rightarrow$ compilation $\rightarrow$ private version $\rightarrow$ CMKIN 1_3_0 + kis_user.F
$\triangleright$ CompHEP 4.2p1 $\rightarrow$ CMKIN 2_0_1 (PYTHIA 6.220) + kis_user.F

## More technical details: simulation/reconstruction

$\triangleright$ CMSIM_133
$\triangleright|\eta|<5.3$, all $\varphi, 0.05<P_{T}$
$\triangleright$ ORCA 7_3_0
$\triangleright$ Write: SimHits, RecHits $\rightarrow$ ROOT DB
$\triangleright$ MuonReco package $\rightarrow$ *.root
$\triangleright$ no off-line Muon analysis yet
$\triangleright$ L3MuonReconstructor used
$\triangleright$ jpgcode (jets and MET reconstruction) $\rightarrow$ *.root
$\triangleright$ iterative cone algorithm used for jet reconstruction
$\triangleright$ cone size 0.5
$\triangleright$ Relevant parts of the both jpgcode.root and MuonReco.root were merged and written to one file
$\triangleright$ In the analysis jet $\mathrm{E}_{\mathrm{T}}$ corrections were also applied
