

Security

David Fergusson

Material from:

Andrea Sciabà

Åke Edlund, JRA3 Manager, KTH

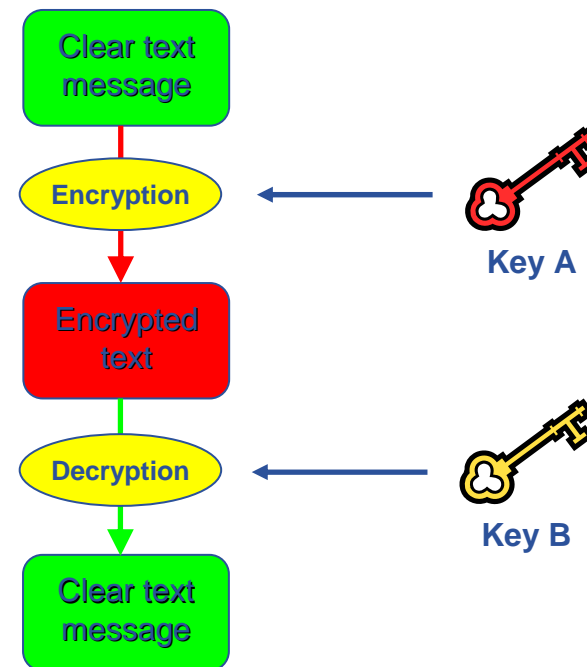

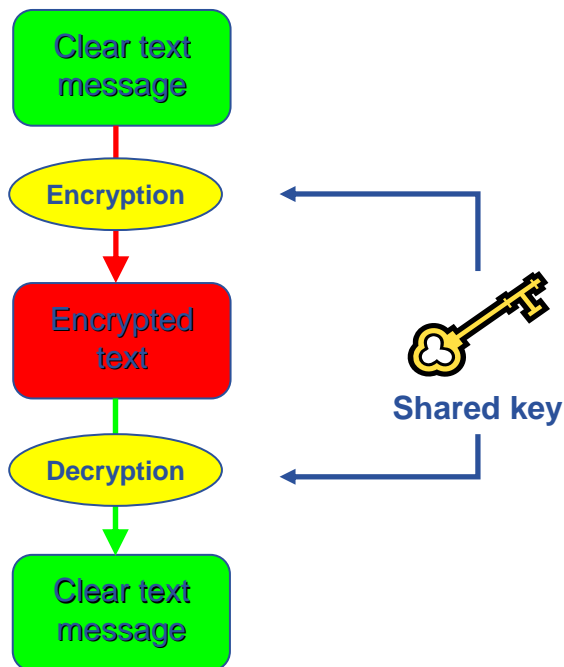

David Groep, EUGridPMA chair, NIKHEF

- **Basic security concepts**
- **Certificates**
- **Virtual Organisations**
- **Command line interface**

- **Principal**
 - An entity: a user, a program, or a machine
- **Credentials**
 - Some data providing a proof of identity
- **Mechanism**
 - software providing data authentication or confidentiality (e.g. Kerberos, GSI)
- **Authentication**
 - Verify the identity of the peer
- **Authorization**
 - Map an entity to some set of privileges
- **Confidentiality**
 - Encrypt the message so that only the recipient can understand it
- **Integrity**
 - Ensure that the message has not be altered in the transmission
- **Non-repudiation**
 - Impossibility of denying the authenticity of a digital signature

- **Symmetric encryption:** same key (“secret”) used for encryption and decryption
 - Kerberos, DES / 3DES, IDEA
- **Asymmetric encryption:** different keys used for encryption and decryption
 - RSA, DSA

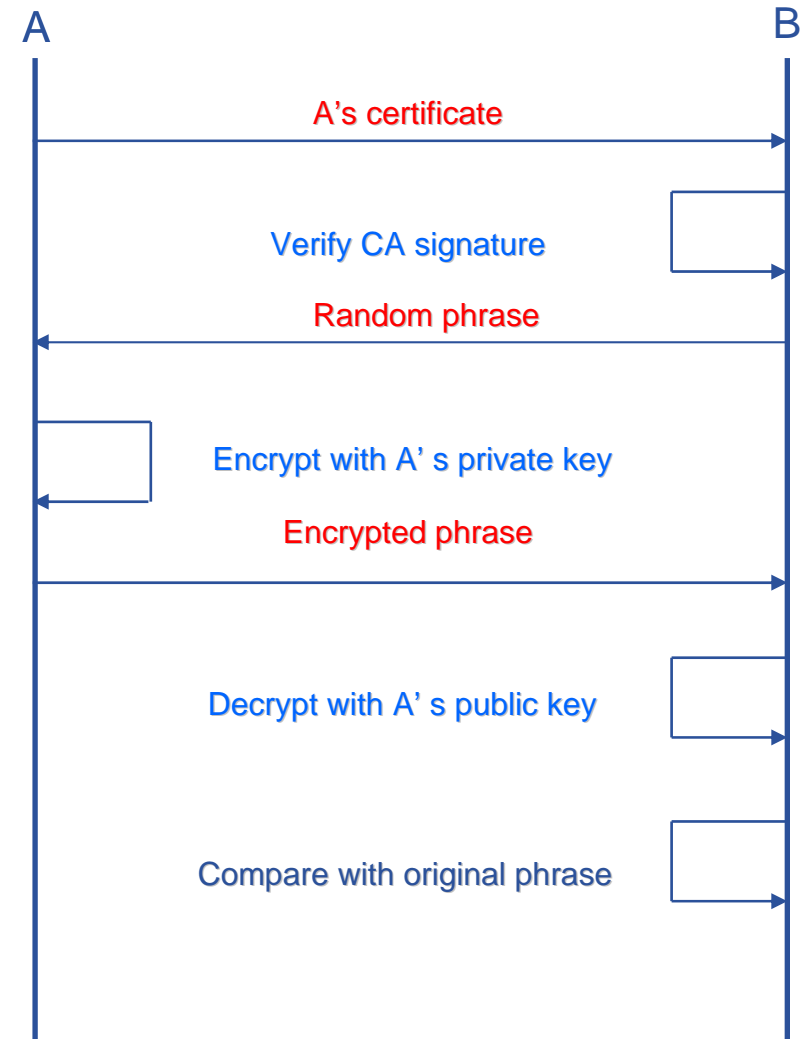

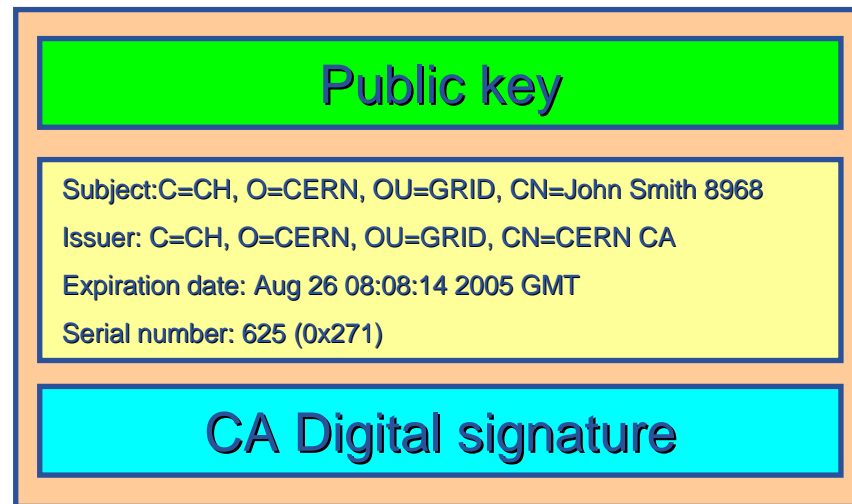

- Provides authentication, integrity, confidentiality, non-repudiation
- Asymmetric encryption

- **Digital signatures**
 - A hash derived from the message and encrypted with the signer's private key
 - Signature checked decrypting with the signer's public key
- **Allows key exchange in an insecure medium using a trust model**
 - Keys trusted only if signed by a trusted third party (Certification Authority)
 - A CA certifies that a key belongs to a given principal
- **Certificate**
 - Public key + information about the principal + CA signature
 - X.509 format most used
- **PKI used by SSL, PGP, GSI, WS security, S/MIME, etc.**

Structure of a X.509 certificate

- Issue certificates for users, programs and machines
- Check the identity and the personal data of the requestor
 - Registration Authorities (RAs) do the actual validation
- Manage Certificate Revocation Lists (CRLs)
 - They contain all the revoked certificates yet to expire
- CA certificates are **self-signed**
- LCG-2 recognizes a given set of CAs
 - https://lcg-registrar.cern.ch/pki_certificates.html

- *de facto* standard for Grid middleware
- Based on PKI
- Implements some important features
 - Single sign-on: no need to give one's password every time
 - Delegation: a service can act on behalf of a person
 - Mutual authentication: both sides must authenticate to the other
- Introduces **proxy certificates**
 - Short-lived certificates including their private key and signed with the user's certificate

- For the Grid to be an effective framework for largely distributed computation, users, user processes and grid services must work in a secure environment.
- **All interactions between WMS components (expecially if network separated) will be mutually authenticated: any entity authenticates itself to the other peer using either its own credential or a delegated user credential or both.**
 - User Interface passing a job to the Network Server.
 - WMS-UI interacting with the Logging and Bookkeeping service.
- The user or service identity and their public key are included in a **X.509 certificate** signed by a trusted **Certification Authority (CA)**, to guarantee the association between that public key and its owner.
- The user has to possess a valid X.509 certificate on the submitting machine, consisting of two files: the *certificate file* and the *private key file*.
 - "\$X509_USER_CERT" and "\$X509_USER_KEY"
 - "\$HOME/.globus/usercert.pem" and "\$HOME/.globus/userkey.pem"

X.509: extracting user{cert | key} files

Usually X.509 Certificates are downloaded using a browser and managed by the browser itself.

- Anyway it is possible to export your certificate in a file PKCS12 (which will probably have the extension .p12 or .pfx).
- Unfortunately PKCS12 format is not accepted by Globus security infrastructure, but you can easily convert it into the supported standard (PEM). This operation will split your *.p12 file in two files: the certificate (usercert.pm) and the private key (userkey.pm).
- *With openssl tool:*
- `$ openssl pkcs12 -nocerts -in mycert.p12 -out userkey.pem`
- `$ openssl pkcs12 -clcerts -nokeys -in mycert.p12 -out usercert.pem`
- `$ chmod 0400 userkey.pem`
- `$ chmod 0600 usercert.pem`
- Permission must be set as shown not only for security reasons: *voms-proxy-init* and *grid-proxy-init* commands will fail if your private key is not protected as listed above.

X.509: Creating a Proxy Certificate

- Actually the user certificate and private key files are not mandatory on the WMS-UI machine:
 - needed for the creation of the proxy user credentials through *grid-proxy-init* or *voms-proxy-init*
 - downloadability of proxy credentials from a trusted site.
- All WMS-UI commands, when started, check for the existence and expiration date of user proxy credentials in the location pointed to by "*\$X509_USER_PROXY*" or in "*/tmp/x509up_u<UID>*" (where *<UID>* is the user identifier in the submitting machine OS) if the X509 environment variable is not set.
- If the proxy certificate does not exist or has expired the WMS-UI returns an error message to the user and exits.
- Notes: Existence of multiple VOs.
- A job gets associated a valid proxy certificate (the submitting user's one) when it is submitted by the WMS-UI to NS. Proxy validity default set to 12 hours unless differently specified.
 - *--valid* *voms-proxy-init*
 - *--hours* *grid-proxy-init*
 - features of MyProxy package. Registering a valid long-term certificate proxy that will be used by the WMS to perform a periodic credential renewal for the submitted job.

X.509: content of the Certificate

- An X.509 Certificate contains:

- owner's public key;
- identity of the owner;
- info on the CA;
- time of validity;
- Serial number;
- digital signature of the CA

Public key

Subject: C=CH, O=CERN,
OU=GRID, CN=Name Surname
8968

Issuer: C=CH, O=CERN,
OU=GRID, CN=CERN CA

Expiration date: Aug 26 08:08:14
2005 GMT

Serial number: 625 (0x271)

CA Digital signature

Consists of a server and a set of client tools that can be used to delegate and retrieve credentials to and from a server.

MyProxy Client commands:

- *myproxy-init*
- *myproxy-info* `// myproxy-info -s <host name> -d`
- *myproxy-destroy*
- *myproxy-get-delegation* `// myproxy-get-delegation -s <host name> -d
-t <hours> -o <output file> -a <user proxy>`
- *myproxy-change-pass-phrase*

The ***myproxy-init*** command allows you to create and send a delegated proxy to a MyProxy server for later retrieval; in order to launch it you have to assure you're able to execute the `grid-proxy-init` or `vomsproxy-init` command.

```
myproxy-init -s <host name> -t <hours> -d -n
```

The `myproxy-init` command stores a user proxy in the repository specified by `<host name>` (the `-s` option). Default lifetime of proxies retrieved from the repository will be set to `<hours>` (see `-t`) and no password authorization is permitted when fetching the proxy from the repository (the `-n` option). The proxy is stored under the same user-name as is your subject in your certificate (`-d`).

- **Delegation**
 - Allowing something else (eg. a file transfer service) to use my credentials
- **Proxies can be moved over a network**
- **Subject identifies the user:**
 - User subject: `/C=CH/O=CERN/OU=GRID/CN=Andrea Sciaba 8968`
 - Proxy subject: `/C=CH/O=CERN/OU=GRID/CN=Andrea Sciaba 8968/CN=proxy`
- **Full proxy**
 - A proxy created from a user certificate or another full proxy with normal delegation
- **Limited proxy**
 - A proxy created from a proxy with limited delegation, or from another limited proxy
- **What does that mean?**

Entities can decide to accept only full proxies. Examples:

 - GridFTP accepts all proxies
 - Globus gatekeeper accepts only full proxies

- **LCG-2 users MUST belong to a Virtual Organization**
 - Sets of users belonging to a collaboration
 - Each VO user has the same access privileges to Grid resources
 - List of supported VOs:
 - https://lcg-registrar.cern.ch/virtual_organization.html
- **VOs maintain a list of their members**
 - The list is downloaded by Grid machines to map user certificate subjects to local “pool” accounts: only mapped users are authorized in LCG

```
...
"/C=CH/O=CERN/OU=GRID/CN=Simone Campana 7461" .dteam
"/C=CH/O=CERN/OU=GRID/CN=Andrea Sciaba 8968" .cms
"/C=CH/O=CERN/OU=GRID/CN=Patricia Mendez Lorenzo-ALICE" .alice
...
```

- Sites decide which VOs to accept grid-mapfile

- **User certificate files:**
 - Certificate: `X509_USER_CERT` (default: `$HOME/.globus/usercert.pem`)
 - Private key: `X509_USER_KEY` (default: `$HOME/.globus/userkey.pem`)
 - Proxy: `X509_USER_PROXY` (default: `/tmp/x509up_u<id>`)
- **Host certificate files:**
 - Certificate: `X509_USER_CERT` (default: `/etc/grid-security/hostcert.pem`)
 - Private key: `X509_USER_KEY` (default: `/etc/grid-security/hostkey.pem`)
- **Trusted certification authority certificates:**
 - `X509_CERT_DIR` (default: `/etc/grid-security/certificates`)
- **Location of the grid-mapfile:**
 - `GRIDMAP` (default: `/etc/grid-security/grid-mapfile`)

- **Get information on a user certificate**

- `grid-cert-info[-help] [-file certfile] [OPTION]...`
 - `-all` whole certificate
 - `-subject | -s` subject string
 - `-issuer | -I` Issuer
 - `-startdate | -sd` Start of validity
 - `-enddate | -ed` End of validity

- **Create a proxy certificate**

- `grid-proxy-init`

- **Destroy a proxy certificate**

- `grid-proxy-destroy`

- **Get information on a proxy certificate**

- `grid-proxy-info`

- **Proxy has limited lifetime (default is 12 h)**
 - Bad idea to have longer proxy
- **However, a grid task might need to use a proxy for a much longer time**
 - Grid jobs in HEP Data Challenges on LCG last up to 2 days
- **myproxy server:**
 - Allows to create and store a long term proxy certificate:
 - `myproxy-init -s <host_name>`
 - `-s <host_name>` specifies the hostname of the myproxy server
 - `myproxy-info`
 - Get information about stored long living proxy
 - `myproxy-get-delegation`
 - Get a new proxy from the MyProxy server
 - `myproxy-destroy`
- **A service running continuously can renew automatically a proxy created from a long term use proxy and use it to interact with the Grid**
 - Examples: automatic job dispatchers or data movers

- **Currently, there are no security APIs developed specifically by LCG**
- **The existing APIs come from other projects**
 - Authentication
 - Globus GSS-API, GSS Assist, COG Kits (Java and Python)
 - some gSOAP plugins (CERN, Lecce University)
 - Authorization
 - LCAS plugins
 - LCMAPS plugins
 - VOMS API
 - some gSOAP plugins (CERN, Lecce University)
- **The documentation is generally not good**

- **Message level security**
 - WS-Security
 - set of SOAP extensions to implement integrity and confidentiality in Web Services
 - <Security> header contains the security-related information
 - <http://www-128.ibm.com/developerworks/library/ws-secure/>
 - WS-SecureConversation
 - defines how to establish secure contexts and exchange keys
 - Used in Globus Toolkit 3
- **Transport level security**
 - SOAP messages are transmitted encrypted
 - used by some gSOAP GSI plugins

- **Enable secure operation of a European Grid infrastructure**
 - Develop security architectures, frameworks and policies
 - Definition of incident response methods and authentication policies
- **Consistent design of security mechanisms for all core Grid services**
 - Meet production needs of resource providers with regard to identity, integrity and protection
- **Provide robust, supportable security components (as part of JRA1)**
 - Select, re-engineer, integrate identified Grid Services
- **Selection of security components is based on requirements of:**
 - Middleware developers
 - Applications
 - Grid operations

Major achievements

- **Producing key security deliverables (well received in the community)**
 - Global Security Architecture
 - Site Access Control Architecture
- **Delivered a number of security modules, of which four will be part of gLite v1**
- **Driving community level agreements for middleware and policy**
 - EUGridPMA

Major issues and mitigation

- **Geographically distributed teams**
 - Need to improve the handing over of security modules to the middleware developers. More F2F meetings.
 - Improve further contact with NA4, applications.
- **Conflicting/challenging security requirements from applications and operations**
 - Proposed solutions meeting the sets of requirements as much as possible.

- Requirement:** Support for legacy and non-WS based software components
- Solution:** Modular authentication and authorization software suitable for integration
- Fulfilled/Time frame:** Yes/Now

Major security issues with current production service

Major issues

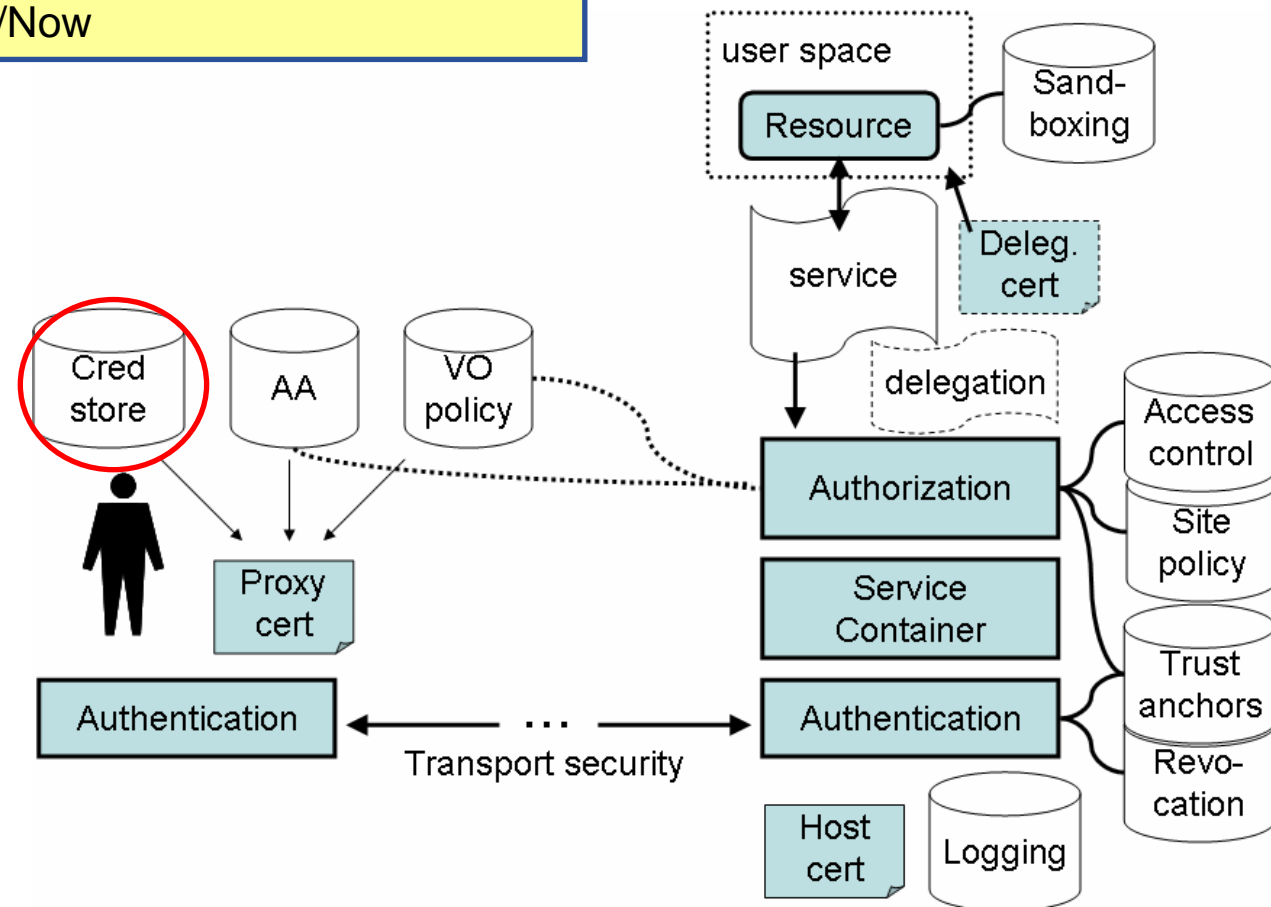

- Many of the services do not have authentication.
- Procedural issues, e.g. in incident handling
- No resource control on the local clusters
- Proliferation of network connectivity (especially outbound)
- Users store private credentials on NFS file systems

Will gLite be any better?

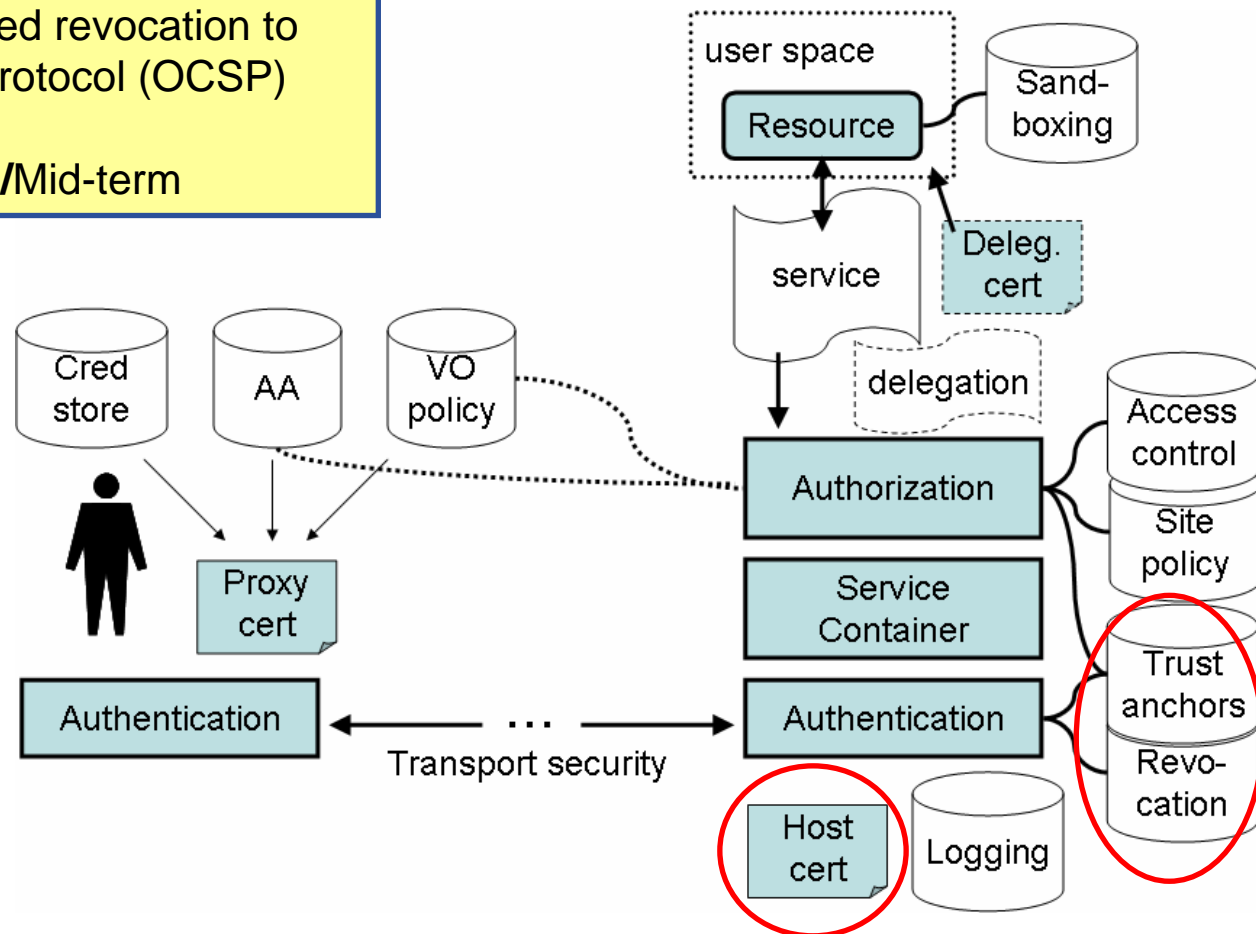

gLite will have less of these limitations, but we will still need to use and deploy the software correctly and within its limitations

- Better and more flexible tools for authorization and credential management
- Improved operational procedures and processes
- New services and solutions addressing the need of new applications

Managed credential storage ensures proper security of credentials. Password-scrambled files should go away
Fulfilled/Time frame: Yes/Now

Requirement: Timely credential revocation
Solution: Gradual transition from Certificate Revocation List (CRL) based revocation to Online Certificate Status Protocol (OCSP) based revocation
Fulfilled/Time frame: Yes/Mid-term

Transport Level Security

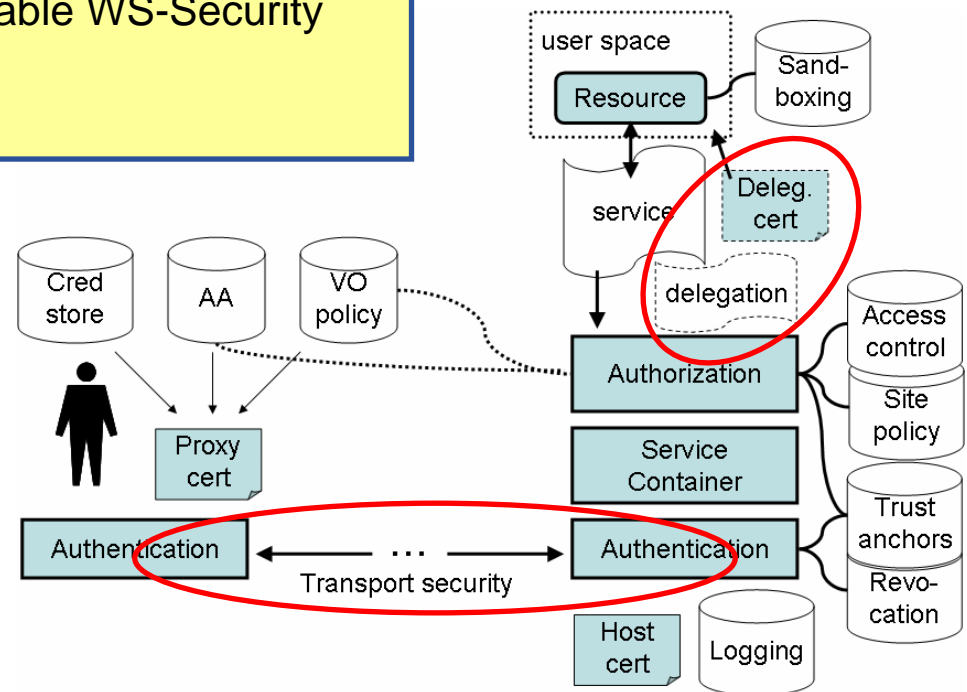

- Uses widely deployed TLS/SSL protocol
- Does not provide security through intermediate hosts (can be done using delegation, not yet delivered).

Message Level Security

- Uses Web Services or SOAP messages security technology
- Recommended by WS-I Consortium as preferable WS-Security solution
- Performance and support issues

So, TLS for now

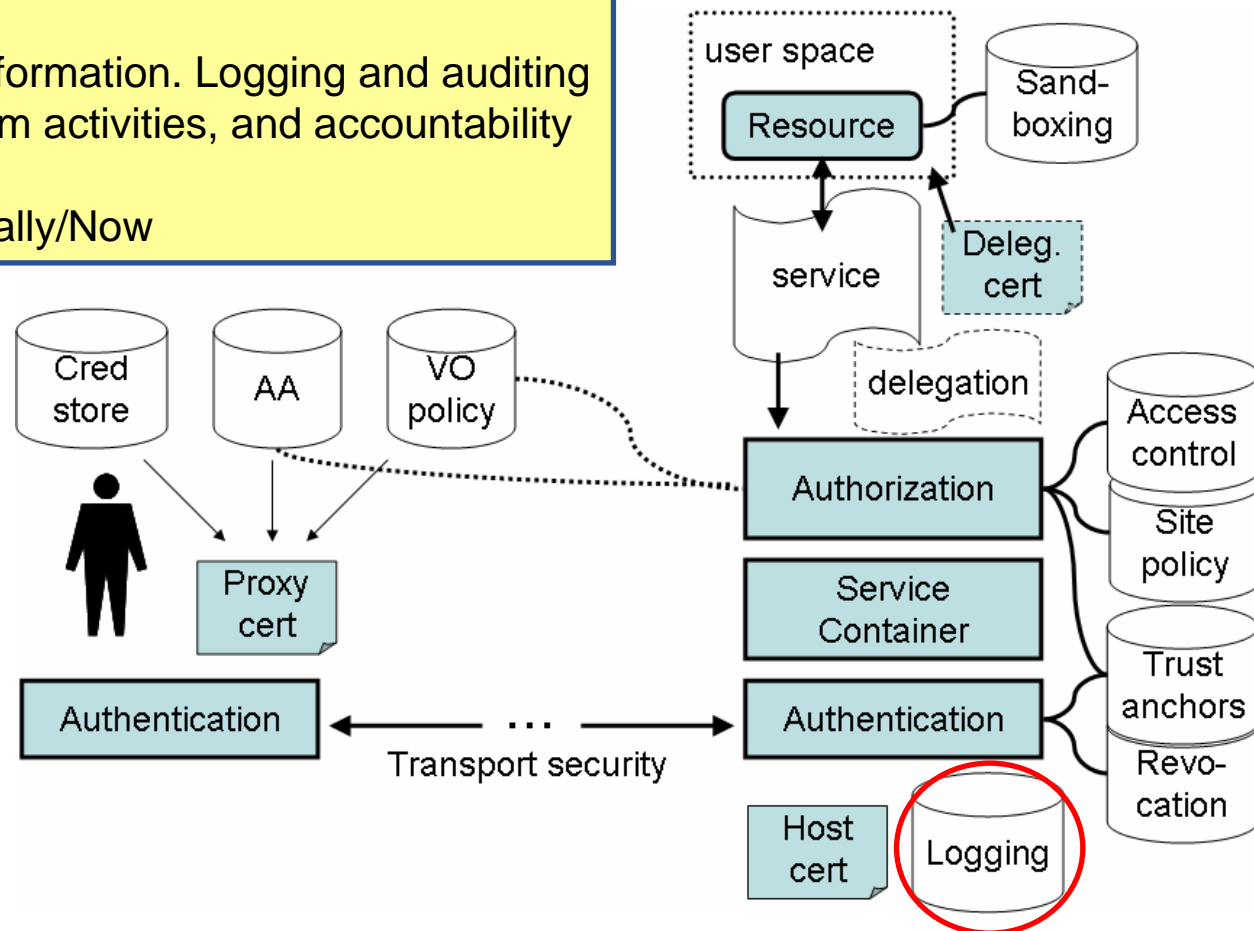

- SOAP over HTTPS with proxy cert supported path validation
- WS interface for delegation
- **Move to MLS as we go along**
- Use cases for MLS exist already (DM)

Requirement: Audit ability

Solution: Meaningful log information. Logging and auditing ensures monitoring of system activities, and accountability in case of a security event

Fulfilled/Time frame: Partially/Now

Requirement: Accountability

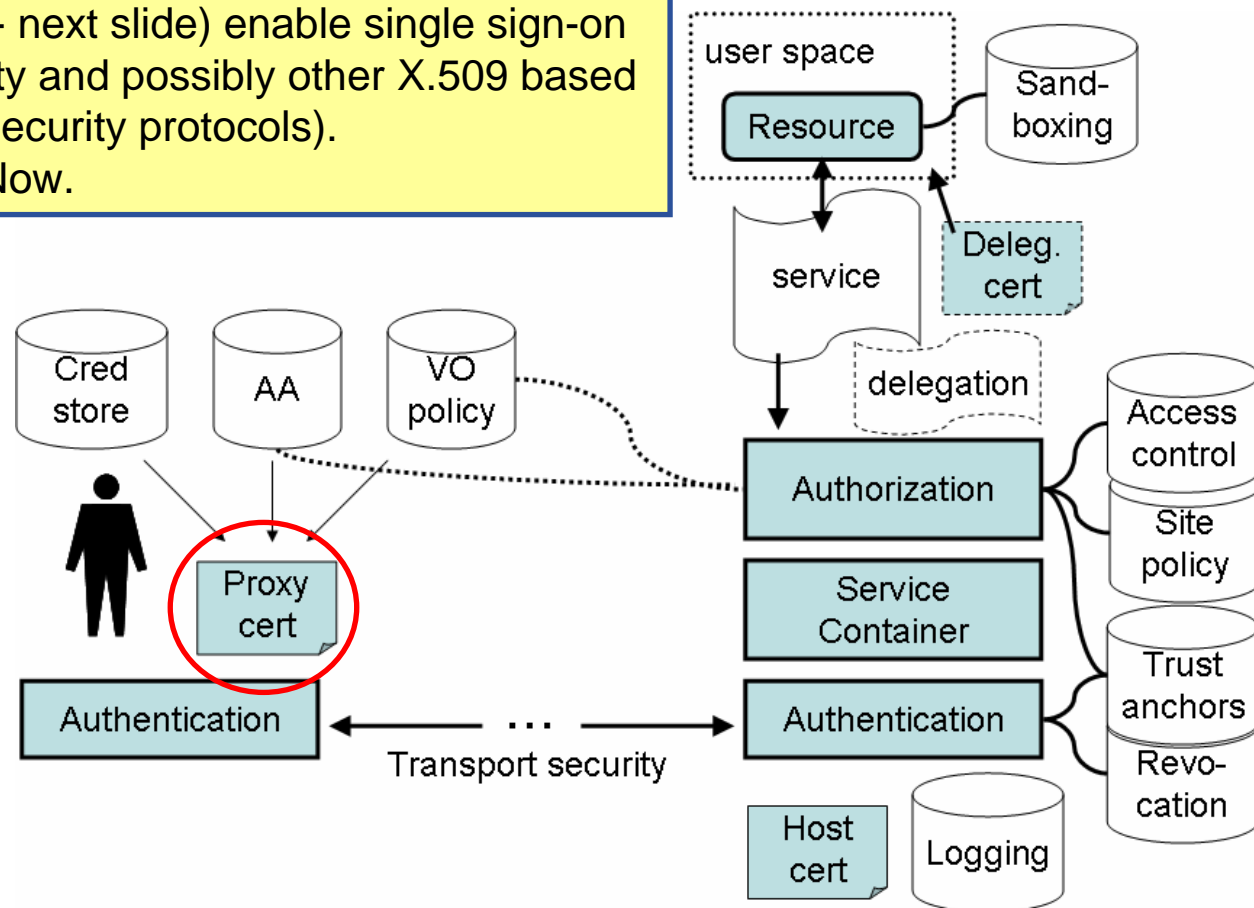

Solution: All relevant system interactions can be traced back to a user

Fulfilled/Time frame: Yes/Now

Requirement: Single sign-on.

Solution: Proxy certificates and a global authentication infrastructure (**EUGridPMA** - next slide) enable single sign-on (using TLS, GSI, WS-Security and possibly other X.509 based transport or message-level security protocols).

Fulfilled/Time frame: Yes/Now.

EUGridPMA (Chair: David Groep, JRA3)

European **Grid** Authentication **Policy**
Management **Authority** for e-Science

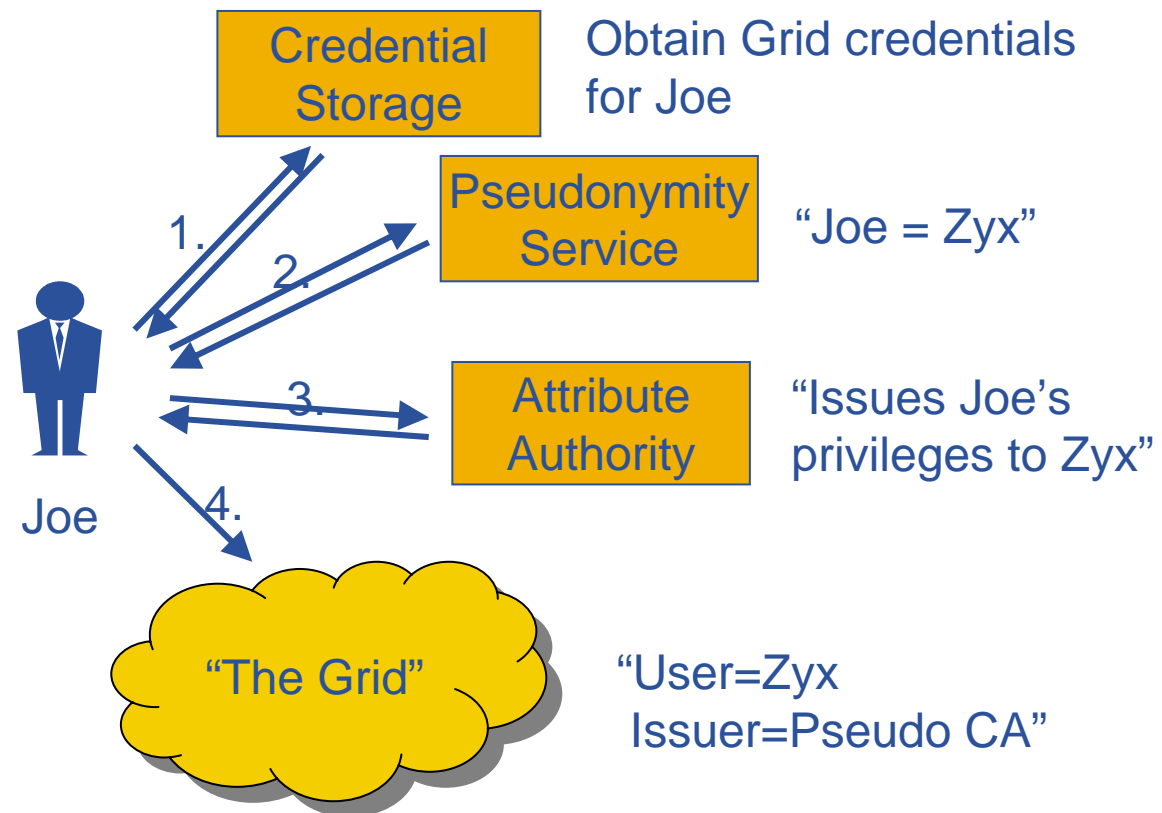

- Setting **guidelines and minimum requirements** for Grid authentication for e-Science
- Now a Global federation of grid identity providers, based on EUGridPMA requirements: **the International Grid Federation (IGF)**
- **EUGridPMA was the driving example** for similar groups in Asian-Pacific and the Americas
- Coverage of Europe almost complete
 - **30 accredited members**
 - 7 non-EU countries + 1 treaty organization
- **Initiative strongly encouraged by the eInfrastructures Reflection Group (eIRG)**

Requirement:User Privacy. **Issue:** Identity anonymity vs. identity traceability

Solution: Pseudonymity services addresses anonymity and privacy concerns.

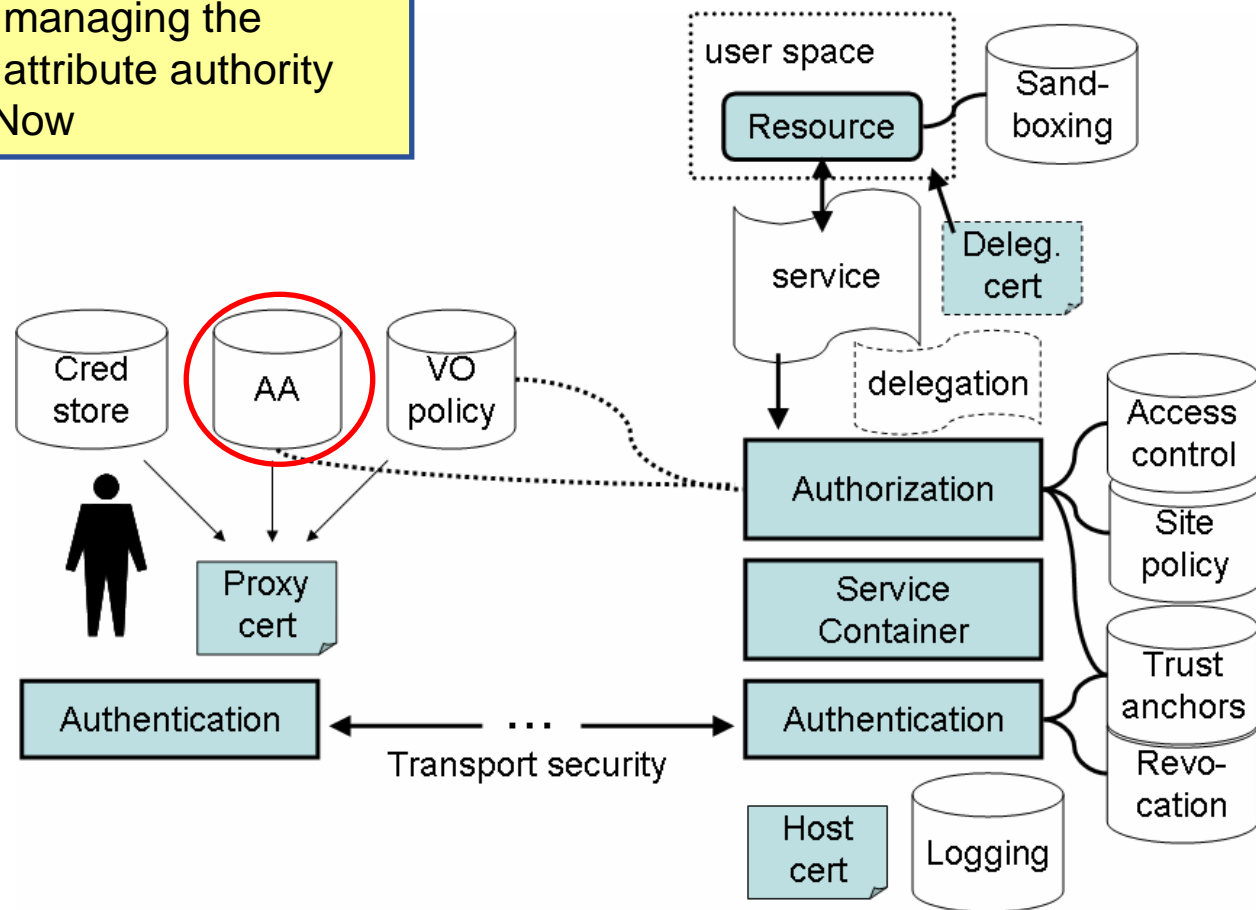

Fulfilled/Time frame: Partially/Mid-term

Requirement: VO managed access control

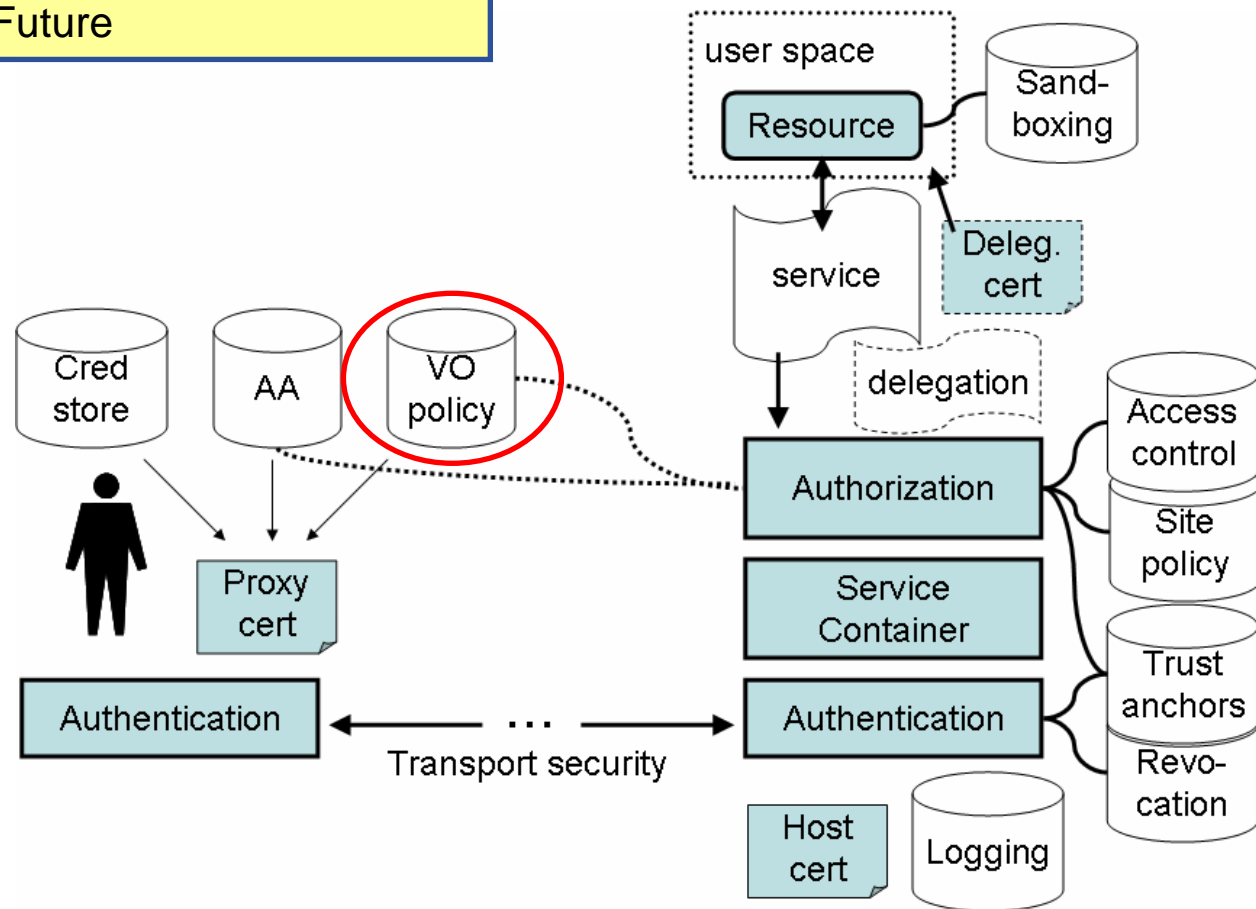

Solution: The Virtual Organization Membership Service (VOMS) is used for managing the membership to VOs and as attribute authority

Fulfilled/Time frame: Yes/Now

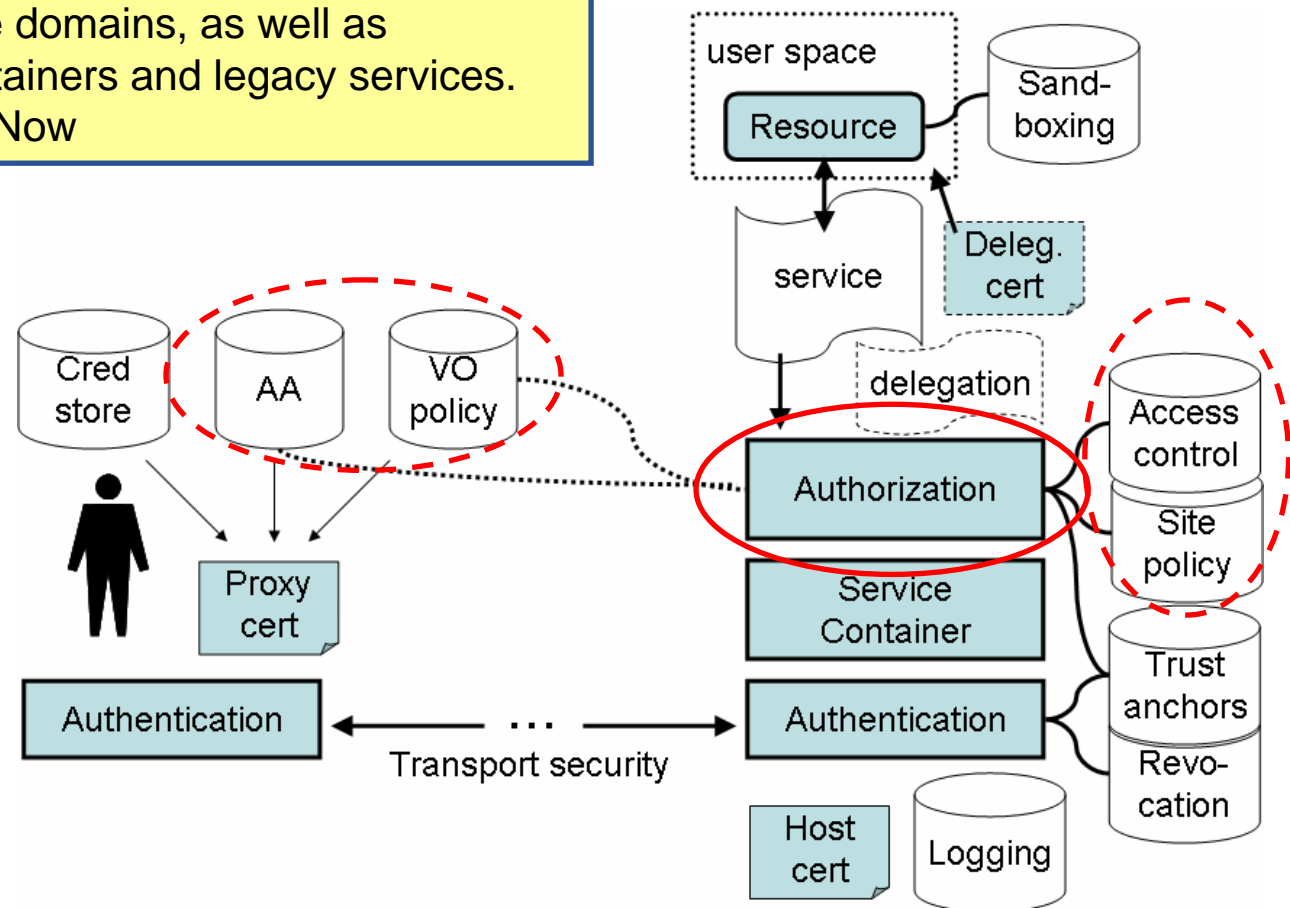

Policy assertion services enable the consolidation and central administration of common policy

Fulfilled/Time frame: Yes/Future

Authorization framework enables local collection, arbitration, customization and reasoning of policies from different administrative domains, as well as integration with service containers and legacy services.
Fulfilled/Time frame: Yes/Now

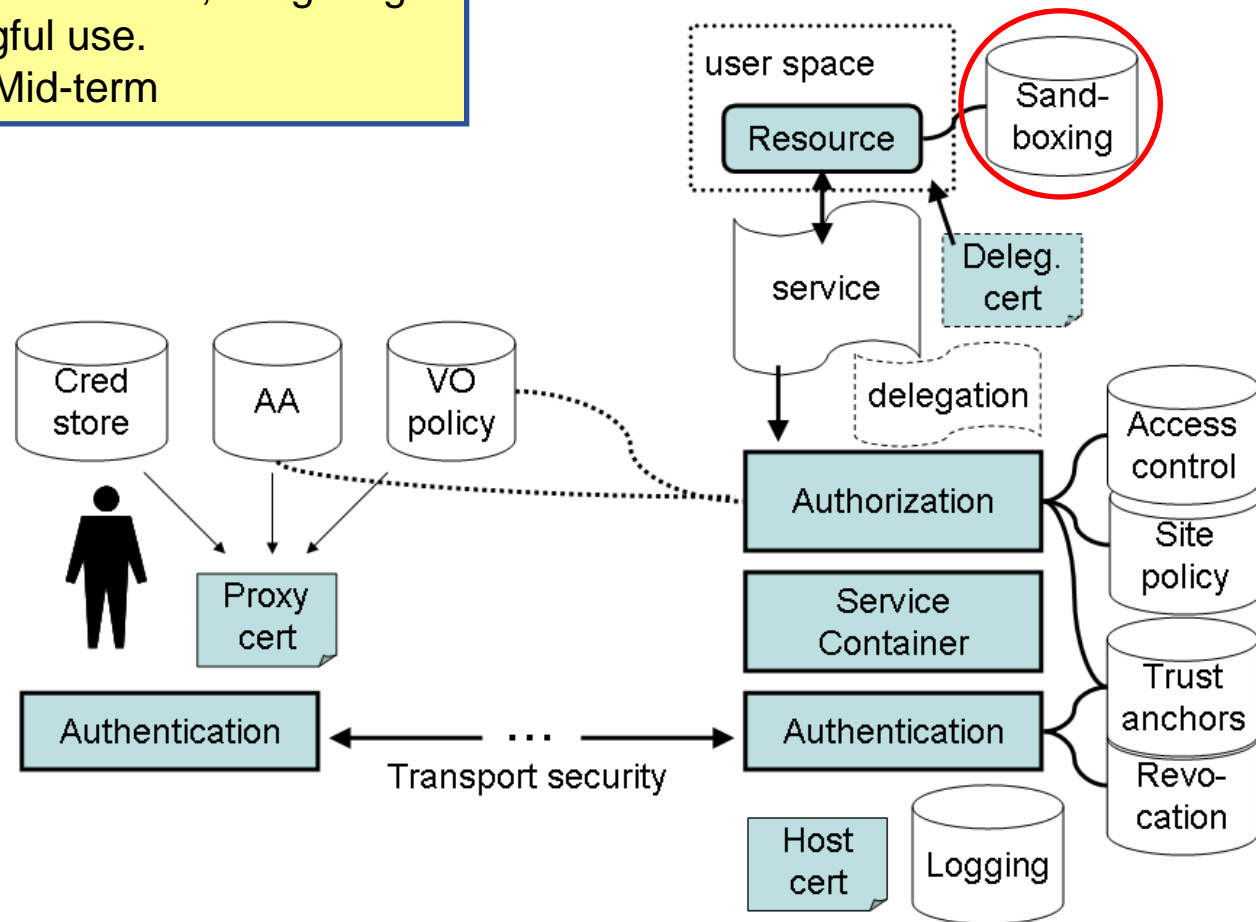

Delegation - Allows for an entity (user or resource) to empower another entity (local or remote) with the necessary permissions to act on its behalf.

Fulfilled/Time frame: Yes/Now

Sandboxing - Isolates a resource from the local site infrastructure hosting the resource, mitigating attacks and malicious/wrongful use.

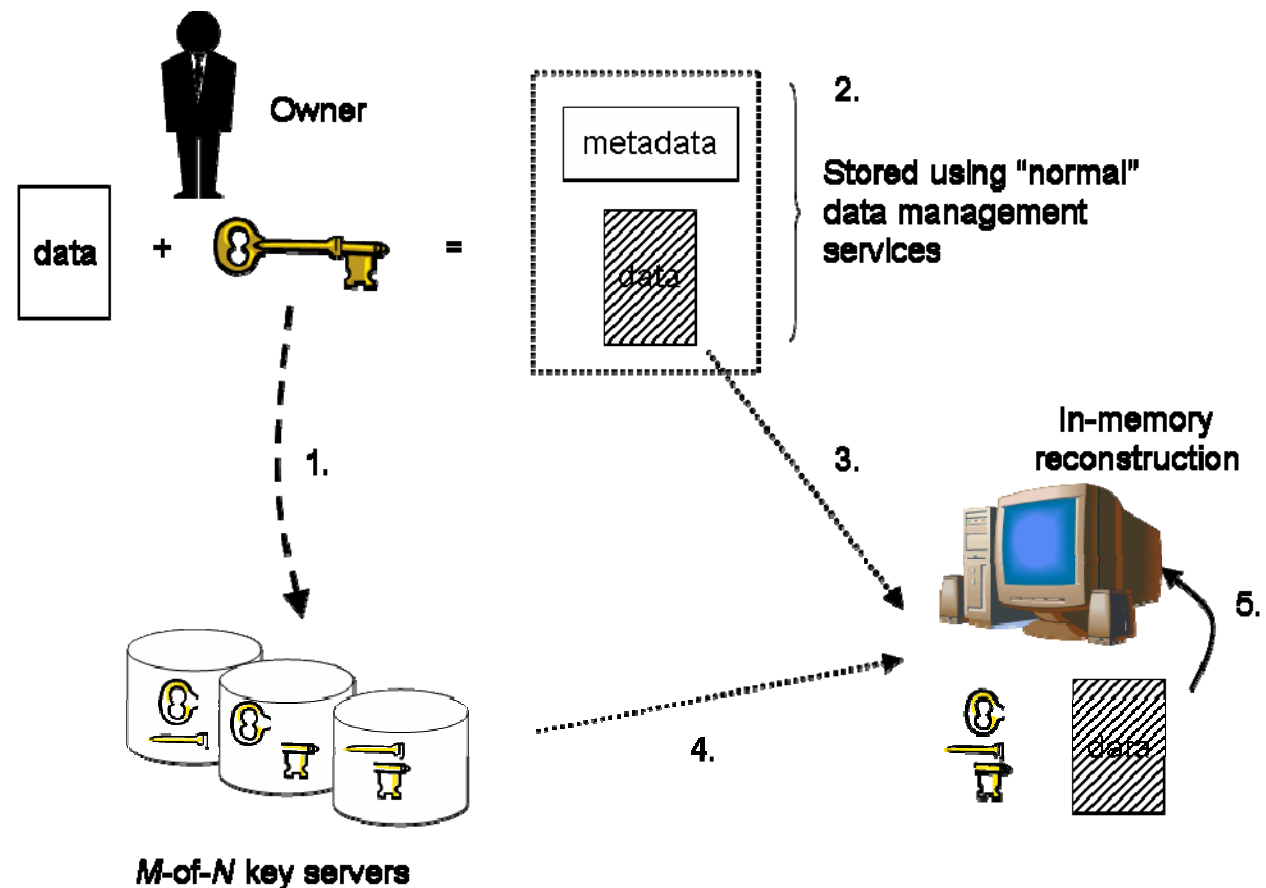

Fulfilled/Time frame: Yes/Mid-term

Requirement: Data Privacy

Solution: Encrypted data storage. Enables long-term distributed storage of data for applications with privacy or confidentiality concerns

Fulfilled/Time frame: Partially/Mid-term

Module candidates for gLite release 1:

- **SOAP over HTTPS**
 - Implements transport layer security for web services
- **Authorization framework**
 - A java rendering of the pluggable authorization framework
- **VOMS support for authorization**
 - The Virtual Organization Membership Service (VOMS) is used for managing the membership to VOs and as attribute authority
- **Resource Access Control (LCAS, LCMAPS, gatekeeper)**
 - Resource access control is based on Local Centre AuthZ Service (LCAS) and Local Credential MAPping Service (LCMAPS). The Globus WorkSpace Service (WSS) is used for account management
