

# Recent progress on neural PDFs

NNPDF Collaboration

HERA and the LHC Workshop

21st March 2005

## The NNPDF Collaboration

Luigi Del Debbio<sup>1</sup>, Stefano Forte<sup>2</sup>,  
José I. Latorre<sup>3</sup>, Andrea Piccione<sup>4</sup> and Joan Rojo<sup>3</sup>,

<sup>1</sup> Theory Division, CERN

<sup>2</sup> Dipartimento di Fisica, Università di Milano and INFN, Sezione di Milano

<sup>3</sup> Departament d'Estructura i Constituents de la Matèria, Universitat de Barcelona

<sup>4</sup> Dipartimento di Fisica Teorica, Università di Torino and INFN, Sezione di Torino

## Motivation

- The name of the game
- Ways out

## Structure Functions

- The NNPDF approach
- Neural Networks
- Results

## Parton Distributions

- The NNPDF approach
- PDF Evolution
- The Fit
- Results

## Conclusions

## DIS data → Structure Functions

- ▶ Structure Function=Hard. Coeff.  $\otimes$  Parton Distn.

$$F^{NC}(x, Q^2) = x \sum_f e_f^2 (q_f + \bar{q}_f) + \alpha_s [C_f(\alpha_s) \otimes (q_f + \bar{q}_f) C_g(\alpha_s) \otimes g]$$

- ▶ Trivial complication: disentangle quark flavors and gluon, evolve to common scale, deconvolute
- ▶ Serious complication: determine errors on PDFs

# The Problem

- ▶ For a single quantity  $\rightarrow$  1 sigma errors
- ▶ For a pair of numbers  $\rightarrow$  1 sigma ellipse
- ▶ For a function  $\rightarrow$  We need the probability measure  $\mathcal{P}[f]$  in the space of functions  $f(x)$

Expectation values  $\rightarrow$  Functional integrals

$$\langle \mathcal{F}[f(x)] \rangle = \int \mathcal{D}f \mathcal{F}[f(x)] \mathcal{P}[f(x)]$$

Determine an infinite-dimensional object (a function) from finite set of data points  $\rightarrow$  Mathematically ill-posed problem

# The standard approach

1. Choose a simple functional form with enough free parameters
2. Fit parameters by minimizing  $\chi^2$

Some difficulties arise:

- ▶ Errors and correlations of parameters require at least fully correlated analysis of data errors
- ▶ Error propagation to observables is difficult: many observables are nonlinear/nonlocal functional of parameters
- ▶ Theoretical bias due to choice of parametrization is difficult to assess (effects can be large if data are not precise or hardly compatible)

# The standard approach

1. Choose a simple functional form with enough free parameters
2. Fit parameters by minimizing  $\chi^2$

Some difficulties arise:

- ▶ Errors and correlations of parameters require at least fully correlated analysis of data errors
- ▶ Error propagation to observables is difficult: many observables are nonlinear/nonlocal functional of parameters
- ▶ Theoretical bias due to choice of parametrization is difficult to assess (effects can be large if data are not precise or hardly compatible)

# The standard approach

1. Choose a simple functional form with enough free parameters
2. Fit parameters by minimizing  $\chi^2$

## Parton Distributions

The NNPDF approach

PDF Evolution

The Fit

Results

## Conclusions

# General strategy: I

- ▶ Monte Carlo sampling of data (Generation of replicas of experimental data) → Faithful representation of uncertainties
- ▶ Neural network training over Monte Carlo replicas → Unbiased parametrization

Expectation values → Sum over the Nets

$$\langle \mathcal{F} [F(x, Q^2)] \rangle = \frac{1}{N_{rep}} \sum_{k=1}^{N_{rep}} \mathcal{F} \left( F^{(net)(k)}(x, Q^2) \right)$$

$\mathcal{P} [F(x)]$  validated through statistical estimators

# General strategy: I

- ▶ Monte Carlo sampling of data (Generation of replicas of experimental data) → Faithful representation of uncertainties
- ▶ Neural network training over Monte Carlo replicas → Unbiased parametrization

Expectation values → Sum over the Nets

$$\langle \mathcal{F} [F(x, Q^2)] \rangle = \frac{1}{N_{rep}} \sum_{k=1}^{N_{rep}} \mathcal{F} \left( F^{(net)(k)}(x, Q^2) \right)$$

$\mathcal{P} [F(x)]$  validated through statistical estimators

## General strategy: I

- ▶ Monte Carlo sampling of data (Generation of replicas of experimental data) → Faithful representation of uncertainties
- ▶ Neural network training over Monte Carlo replicas → Unbiased parametrization

Expectation values → Sum over the Nets

$$\langle \mathcal{F} [F(x, Q^2)] \rangle = \frac{1}{N_{rep}} \sum_{k=1}^{N_{rep}} \mathcal{F} \left( F^{(net)(k)}(x, Q^2) \right)$$

$\mathcal{P} [F(x)]$  validated through statistical estimators

# General strategy: II

# Structure I

Neural networks: a class of algorithms providing robust, universal, unbiased approximants to incomplete or noisy data

## Structure II

- ▶ Building blocks: neurons, *i. e.* input/output units characterized by sigmoid activation

$$\xi_i^{(l)} = g \left( \sum_{j=1}^{n_l-1} \omega_{ij}^{(l-1)} \xi_j^{(l-1)} - \theta_i^{(l)} \right) \quad g(x) = \frac{1}{1 + e^{-x}}$$

- ▶ Parameters: weights  $\omega_{ij}^{(l)}$  and thresholds  $\theta_i^{(l)}$ .
- ▶ Architecture: multilayer feed-forward NN. Each neuron receives input from neurons in preceding layer and feeds output to neurons in successive layer
- ▶ Assumption: smooth function

# Training

- ▶ Architecture: redundant to avoid smoothing bias
- ▶ Learning: supervised training on covariance matrix error (highly nonlocal error function)
- ▶ Training method: Genetic Algorithm (extremely effective to find the global minimum, but slow convergence rate)

# Strategy

Same strategy as with SF + Altarelli-Parisi evolution

- ▶ Monte Carlo sampling of data
- ▶ Parametrize parton distributions with neural networks
- ▶ Evolution of parton distributions to experimental data scale and training over Monte Carlo replica sample

The probability measure  $\mathcal{P}[q]$  contains all information from experimental data (central values, errors, correlations)

# Strategy

- ▶ Parametrize parton distributions with neural networks
- ▶ Evolution of parton distributions to experimental data scale and training over Monte Carlo replica sample

The probability measure  $\mathcal{P}[q]$  contains all information from experimental data (central values, errors, correlations)

# Examples

- ▶ Expectation values:

$$\langle \mathcal{F}[q(x)] \rangle = \frac{1}{N_{rep}} \sum_{k=1}^{N_{rep}} \mathcal{F}(q^{(net)(k)}(x))$$

- ▶ Correlations between pairs of different parton distributions at different points:

$$\langle u(x_1)d(x_2) \rangle = \frac{1}{N_{rep}} \sum_{k=1}^{N_{rep}} u^{(net)(k)}(x_1, Q_0^2) d^{(net)(k)}(x_2, Q_0^2)$$

## Examples

- ▶ Expectation values:

$$\langle \mathcal{F}[q(x)] \rangle = \frac{1}{N_{rep}} \sum_{k=1}^{N_{rep}} \mathcal{F}(q^{(net)(k)}(x))$$

- ▶ Correlations between pairs of different parton distributions at different points:

$$\langle u(x_1)d(x_2) \rangle = \frac{1}{N_{rep}} \sum_{k=1}^{N_{rep}} u^{(net)(k)}(x_1, Q_0^2) d^{(net)(k)}(x_2, Q_0^2)$$

## Evolution kernel

- ▶ We want Mellin space evolution:

$$q(N, Q^2) = q(N, Q_0^2) \Gamma(N, \alpha_s(Q^2), \alpha_s(Q_0^2))$$

- ▶ We do not want complex neural networks:

$$\Gamma(x, \alpha_s(Q^2), \alpha_s(Q_0^2)) \equiv \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} dN x^{-N} \Gamma(N, \alpha_s(Q^2), \alpha_s(Q_0^2))$$

- ▶  $\Gamma(x)$  is a distribution  $\rightarrow$  must be regularized at  $x = 1$ :

$$q(x, Q^2) = q(x, Q_0^2) \int_x^1 dy \Gamma(y) + \int_x^1 \frac{dy}{y} \Gamma(y) \left( q\left(\frac{x}{y}, Q_0^2\right) - yq(x, Q_0^2) \right)$$

## Evolution kernel

- ▶ We want Mellin space evolution:

$$q(N, Q^2) = q(N, Q_0^2) \Gamma(N, \alpha_s(Q^2), \alpha_s(Q_0^2))$$

- ▶ We do not want complex neural networks:

$$\Gamma(x, \alpha_s(Q^2), \alpha_s(Q_0^2)) \equiv \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} dN x^{-N} \Gamma(N, \alpha_s(Q^2), \alpha_s(Q_0^2))$$

- ▶  $\Gamma(x)$  is a distribution  $\rightarrow$  must be regularized at  $x = 1$ :

$$q(x, Q^2) = q(x, Q_0^2) \int_x^1 dy \Gamma(y) + \int_x^1 \frac{dy}{y} \Gamma(y) \left( q\left(\frac{x}{y}, Q_0^2\right) - yq(x, Q_0^2) \right)$$

## Evolution kernel

- ▶ We want Mellin space evolution:

$$q(N, Q^2) = q(N, Q_0^2) \Gamma(N, \alpha_s(Q^2), \alpha_s(Q_0^2))$$

- ▶ We do not want complex neural networks:

$$\Gamma(x, \alpha_s(Q^2), \alpha_s(Q_0^2)) \equiv \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} dN x^{-N} \Gamma(N, \alpha_s(Q^2), \alpha_s(Q_0^2))$$

- ▶  $\Gamma(x)$  is a distribution  $\rightarrow$  must be regularized at  $x = 1$ :

$$q(x, Q^2) = q(x, Q_0^2) \int_x^1 dy \Gamma(y) + \int_x^1 \frac{dy}{y} \Gamma(y) \left( q\left(\frac{x}{y}, Q_0^2\right) - yq(x, Q_0^2) \right)$$

## Some details

- ▶ At higher orders  $\rightarrow$  Wilson coefficients  $C(N, \alpha_s(Q^2))$

$$\tilde{r}(x, \alpha_s(Q^2), \alpha_s(Q_0^2)) = \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} dN x^{-N} C(N, \alpha_s(Q^2)) \Gamma(N)$$

- ▶ Mellin transform inversion of evolution factor is crucial.  
We tested different paths and algorithms  $\rightarrow$  Fixed Talbot

## Some details

- ▶ At higher orders  $\rightarrow$  Wilson coefficients  $C(N, \alpha_s(Q^2))$

$$\tilde{r}(x, \alpha_s(Q^2), \alpha_s(Q_0^2)) = \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} dN x^{-N} C(N, \alpha_s(Q^2)) \Gamma(N)$$

- ▶ Mellin transform inversion of evolution factor is crucial.  
We tested different paths and algorithms  $\rightarrow$  Fixed Talbot

# Interpolation

- ▶ During *pdf training*  $\Gamma(x)$  is called many times  $\rightarrow$  Interpolate  $\Gamma(x)$  before the fit (hard numerical task)
- ▶ For each  $Q^2$  bin  $x$  interpolation with  $\sim 100$  Chebyshev polynomials

$$\Gamma(x) \approx \left[ \sum_{k=1}^N c_k T_{k-1}(x) \right] - \frac{1}{2} c_1 \quad T_n(x) = \cos(n \arccos x)$$

# Interpolation

$$\begin{aligned}
 q^{NS}(x, Q^2) &= q^{NS}(x, Q_0^2) + \int_x^1 \frac{dy}{y} \Gamma(y) \left( q^{NS} \left( \frac{x}{y}, Q_0^2 \right) - yq^{NS}(x, Q_0^2) \right) \\
 &- q^{NS}(x, Q_0^2) \int_0^x dy \Gamma(y)
 \end{aligned}$$

$$x = 1$$

- ▶ Structure functions → artificial points:

$$F_2(x = 1, Q^2) = 0$$

- ▶ Parton Distributions → Lagrange multiplier:

$$\chi^2 = \chi^2 + \lambda \left( q^{NS}(x = 1, Q_0^2) \right)^2, \quad \lambda = 10^6$$

$$x = 1$$

- ▶ Structure functions → artificial points:

$$F_2(x = 1, Q^2) = 0$$

- ▶ Parton Distributions → Lagrange multiplier:

$$\chi^2 = \chi^2 + \lambda \left( q^{NS}(x = 1, Q_0^2) \right)^2, \quad \lambda = 10^6$$

## Details

- ▶ Experimental data: NMC (202 pts) and BCDMS (254 pts)
- ▶ Kinematical cuts:  $Q^2 \geq 4 \text{ GeV}^2$ ,  $W^2 \geq 6.25 \text{ GeV}^2$
- ▶ Neural network architecture: 2-2-2-1 (15 params.)
- ▶ Strong coupling:  $\alpha_s(M_Z^2) = 0.1182$
- ▶ VFN:  $m_c = 1.5 \text{ GeV}$ ,  $m_b = 4.5 \text{ GeV}$ ,  $m_t = 175 \text{ GeV}$
- ▶ TMC:  $F_2$  integral evaluated with NN  $F_2$
- ▶ # replica: 50
- ▶ Time:  $\sim 2$  hours per replica on CPU 2.6 GHz  
( $\sim 1000$  GA generations)

# NLO $q^{NS}(x, Q^2)$

$F_2^{NS}$  vs.  $x$ 

$F_2^{NS}$  vs.  $Q^2$ 

# Summary

- ▶ Unbiased determination of structure functions with faithful estimation of uncertainties
- ▶ Successful implementation of neural parton fitting at NLO (errors and correlations are forthcoming)

# Outlook

- ▶ Construct full set of NNPDF parton distributions from all available data
- ▶ Estimate impact of theoretical uncertainties
- ▶ Assess impact of uncertainties of PDFs for relevant observables at LHC
- ▶ Perform a benchmark set of pdfs, to compare the different fitting programs (CTEQ, MRST, Alekhin)
- ▶ Make formalism compatible with standard interfaces (LHAPDF, PDFLIB) → NNPDF partons available for use in Monte Carlo generators

## SF: Extras I

Kinematic of data used in the NN fit:

## SF: Extras II

Comparison between the old and the new NN fit of  $F_2^P$ :

$$P(x, Q^2) \equiv \frac{F_2^{new}(x, Q^2) - F_2^{old}(x, Q^2)}{\sqrt{\sigma_{old}^2(x, Q^2) + \sigma_{new}^2(x, Q^2)}}$$

## PDF: Extras I

Mellin Inversion with the Fixed Talbot algorithm:

$$f(t) = \frac{1}{2\pi i} \int_C ds e^{ts} \tilde{f}(s), \quad t = -\ln x$$

$$s(\theta) = r\theta (\cot \theta + i), \quad -\pi \leq \theta \leq \pi$$

$$f(t) = \frac{r}{\pi} \int_0^\pi d\theta \operatorname{Re} \left[ \exp(ts(\theta)) \tilde{f}(s(\theta)) (1 + i\sigma(\theta)) \right]$$

$$\sigma(\theta) = \theta + (\theta \cot \theta - 1) \cot \theta$$

$$f(t, M) = \frac{r}{M} \left[ \frac{1}{2} \tilde{f}(r) e^{rt} + \sum_{k=1}^{M-1} \operatorname{Re} \left[ \exp(ts(\theta_k)) \tilde{f}(s(\theta_k)) (1 + i\sigma(\theta_k)) \right] \right]$$

$$r = \frac{2M}{5t}, \quad \theta_k = \frac{k\pi}{M}$$

## PDF: Extras II

$\chi^2$  vs. NN architecture:
