

Service Request / Service Activation

F2F, EGEE04 conference, Pisa, Italy

Florian Scharinger, EPCC

- **SA/SR main questions:**
 - How to distinguish between SR and SA
 - How to change BAR interface
 - Can we find the correct SR for a SA automatically?
 - How to authorise user for SA

- **Possibilities:**
 - Source/Destination: SR specifies sub-net, SA specifies exact IP address
 - Separate operations
 - Separate (Web) services

- **Request, Cancel, Query for SR *and* SA?**
- **Can we use same parameters for SR and SA?**
- **Naming?**
 - SaQuery, SaGdftRequestService, SaVllRequestService,...
 - SrQuery, SrGdftRequestService, SrVllRequestService,...
- **Adding source/destination port?**
 - But optional?

- **Map**
 - SA source/destination IP to
 - SR source/destination sub-net
 - No overlapping SR possible
- **Or does the user has to pass the SR handle for each SA request?**
 - Even so, how to validate that SA really belongs to passed SR handle?

- **Do we need to authorise that a certain user can request an SA for a specific SR?**
- **If yes, how?**
 - SR would need to contain a list of authorised users
