

LHCb and VOMS

GDB March 2006

1. **Individual** use of the GRID.
2. A number of users want to **share** the task of running on the GRID:
 - Some are in charge of creating jobs
 - Some are in charge of submitting jobs
 - Some are in charge of monitoring job
 - Some are in charge of retrieving outputs
 - Some are in charge of cleaning
 - ...
 - This is already the case for MC production, but will be a similar case for most sub-detector activities, alignment, calibration, group-analysis,...
3. The VO managers with “**root**” like privileges:
 - A user has filled some SE, causing problems to other users.
 - ...

- **Philosophy.**
 - Maximum simplicity
- **All lhcb users are assigned to:**
 - /lhcb
- **VOMS Groups** are created for users that need to share resources:
 - /lhcb/production
 - /lhcb/...
- **VOMS Roles** required for different MW behaviours.
- Short user **VOMS “Alias”** used to assign a simple (e.g. CERN AFS account) unique name to each VO user.
- **VOMS proxy** holds a selected Group/Role if needed.
 - Only the first Group/Role held in the proxy matters.

- Middleware uses information in **VOMS proxy** to assign the user to a given Group/Role
- By default “lhcb:/lhcb” is used. But ...
 - The user fully keeps the identity i.e. user is owner of jobs & data.
 - He/she is the only one allowed to access to his/her jobs.
 - He/she is the only one with write access to his/her data.
- If a given **group** is selected in the proxy:

```
# voms-proxy-init -voms lhcb:/lhcb/production/Role=Group
```

 - The **group becomes the owner** of jobs and data.
 - Other group members have full access to jobs and data.
 - The default user proxy has no longer full access.

- The “**User**” Role: lhcb:/lhcb[/Role=User]
- The “**Group**” member Role: lhcb:/lhcb/XXXX/Role=Group
- The “**Manager (=Admin?)**” Role:
 - Middleware uses information in **VOMS proxy** to assign the user to a given Group/Role.
 - One or more Manager users for the VO and for each group.
voms-proxy-init -voms lhcb:/lhcb[/xxxx]/Role=Manager
 - The **VO Manager** must authorize the registration of new users in the VO (lhcb:/lhcb).
 - The **VO Manager** is responsible of creating new groups (+ Group Manager).
 - The **Group Manager** must authorize users entering the group.
 - The **VO Manager** has full access to jobs and data.

Groups	Roles		
	User	Group (Member)	Manager
/lhcb	Allowed	Not Allowed	Allowed
/lhcb/production	Not Allowed	Allowed	Allowed
/lhcb/xxxx	Not Allowed	Allowed	Allowed

- Group/Role is selected using the voms proxy.
- Mapping to local user is dynamic (not based on DN).
- In all cases, by default, any VO member has read access to data.
- LHCb needs Groups to share tasks in the GRID.
- Higher priority to data management m/w with respect of workload management m/w.
