Introduction

- Data audification is the representation of data by sound signals;
- it can be considered as the acoustic counterpart of data graphic visualization, a mathematical mapping of information from data sets to sounds.
- In the past twenty years the word “audification” has acquired a new meaning in the world of computer music, computer science, and auditory display application development.

Motivations

- Sonic representations are particularly useful when dealing with complex, high-dimensional data, or in data monitoring tasks where it is practically impossible to use the visual inspection.
- Patterns and/or trends recognizing through sound, (in particular for some categories of evolutions, which were hardly perceivable otherwise).

Advantages of hearing

- Hearing is non-directional
- It is surely easier to recognize a change in a sound with respect to a modification in something which has to be looked at.
- It is quite impossible to distinguish a blinking light flashing 100 times a second from another one flashing at 200, 1000, or 10000 times a second, while anyone can recognize periodic signals from 20 Hz to (almost) 20000 Hz

Sonification on the GRID network

- First experiments involving sound production with INFN-GRID facilities started during the last months of 2003.
- In September 2003, it was installed CSound, a free and cross-platform acoustic compiler, on a GRID test site, the Catania INFN-GRID computer farm
- The compiler was tested within the new environment and since its beginning, the test phase produced interesting results: efficient use of the calculus resources, customizable quality of the audio files.

Second Phase: Java

- Second test phase: development of a sound production suite based on Java (equipped with the standard audio and math libraries), more flexible and easy to manage.
- All the results presented in this website have been carried on using this last approach: sample computation, audio rendering, DFT computing were obtained with the Java sonification program

Sound form volcanoes

- Sonified data (provided by the INGV) were geophysical data collected by a digital seismograph placed on the Etna volcano in Catania (Italy).
- The hope is to learn more about eruption dynamics from sonograms
- We performed both a seismogram sonification (tranformation into an audible waveform) and a seismogram melodisation (tranformation into a melody)

About seismograms audification

- In both the cases, structural properties of the seismographic information would be straightly mapped into sound or melody properties

- In the first case, regularities in the seismograms will be reflected by the existence of spectral lines in the sonified signal

- In the second case, regularities in the seismograms will be transferred into regularities in the melody (such as a repeated set of data will become a repeated musical phrase)

Seismograms sonification

- Seismographical data have been recorded onto the surface of Mount Etna volcano, by a digital seismograph at a sampling frequency of about 100 Hz (100.1603 Hz).
- Here follows an example taken from one of the ASCII files processed:

Original data

ASCII files processed (sample):

Starting time: 15/06/2001 00:03:39.920

Frequency: 100.1603 Hz

Samples: 168960

From data to waveform

- Scaling procedure to properly arrange the samples in the [-1,1] interval, according to their sampling frequency.
- In particular, users can specify in the program a certain resample frequency (pitch shift).
- An array of audio samples is constructed.

Resample factor

- Setting resample factors in the Java code greater than 1 won't preserve the original pitch, allowing a frequency shift...
- ....making audible regular phenomena happening at very low frequencies.
- In this way it is possible to observe and study periodical patterns, regular behaviors, long-range correlations, which can happen at different time scales.

Quasi-regular phenomena

- The waveform coded in the audio file will have exactly the same regularities, also recognizable thanks to the presence of some higher lines in the spectrum.
- The order of magnitude of the frequency of quasi-regular phenomena is in the range 0-50 Hz, with a spectral envelope centered around 25-30 Hz.

Melodisation

https://gilda.ct.infn.it/

https://grid-demo.ct.infn.it/

Data melodisation

- The whole data set interval is mapped on the (equally tempered) piano keyboard
- The min value of the seismographic data will correspond to the lowest playable note on the piano keyboard
- The max value to the highest playable note

Example: Sinusoidal behavior

GRID Sonifications

Domenico Vicinanza

Seismograms melodisation

To each value of the seismograms it has been associated a note on the pentagram.

Repeated sequences in data set of the digital seismograph become repeated melodies

Etna Volcano
Seismograms Sonification

Domenico Vicinanza
(INFN-GRID network)

Text sonification

- To each character of a text it will be chosen a musical note according to the position of the letter (namely its ASCII code) into the English alphabet.
- In this way a "B" will be a semitone higher with respect to a "A", a "D" a third minor higher.
- The algorithm is case sensitive, so that a "B" will be lower than a "b".
- The duration of the consonants the one of a 1/16 note while the duration of vowels is a 1/8 note.

3D Data visualization

- As we have seen to each value of the data set we can associate a point of a waveform, a note of a melody...
- ...or even a graphical object
- The 3D data visualization package works associating a sphere to each datum
- Spheres radius, position, optical properties (such as IOR, reflection index, light diffusion, ...) are calculated as a function of the original data

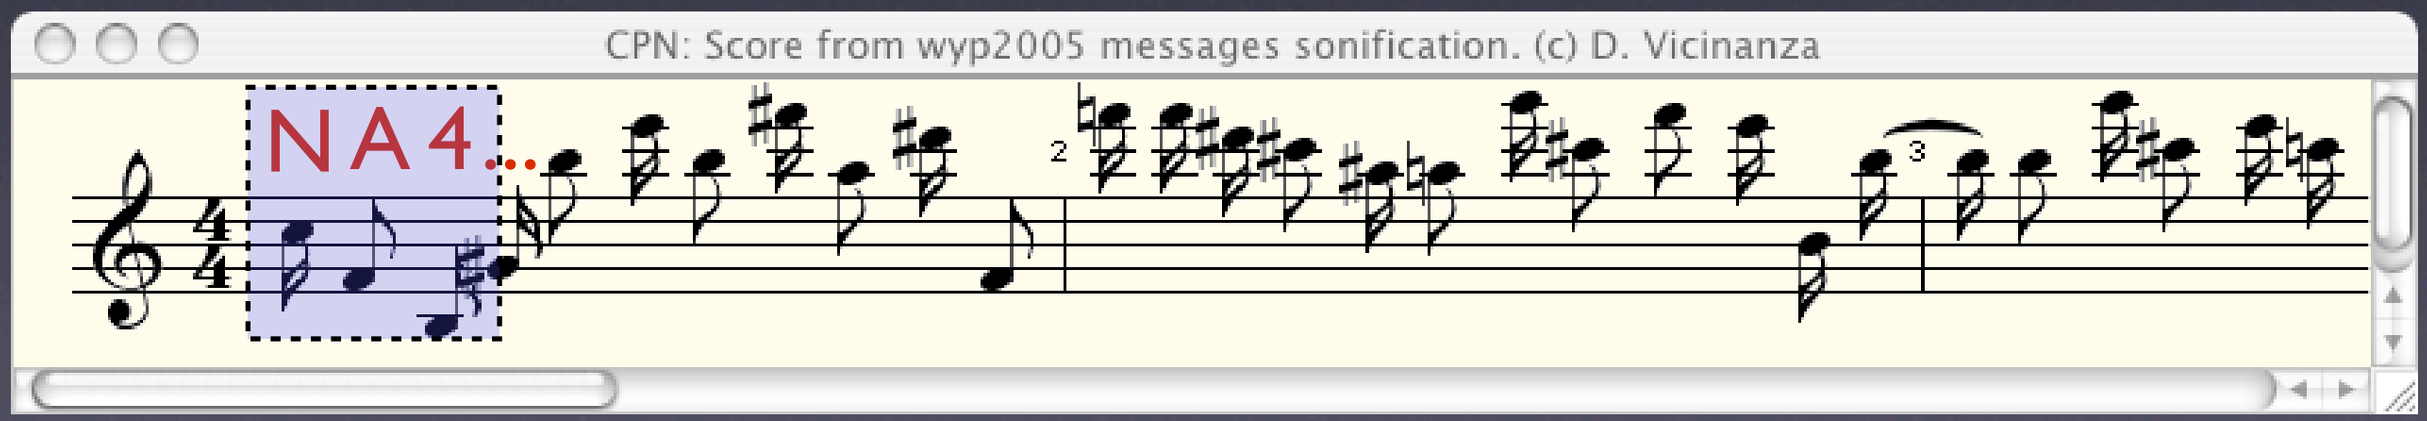
Rendering

- The whole set of data will be associated to a set of spheres ready to be rendered thanks to a Java program
- The final rendering is carried out using POVRay.
- It follows a list of examples produced using differente visulization parameters (namely, different backgrounds, lights, distortions, zooms, ...)

"NA4 Generic Appl." audification

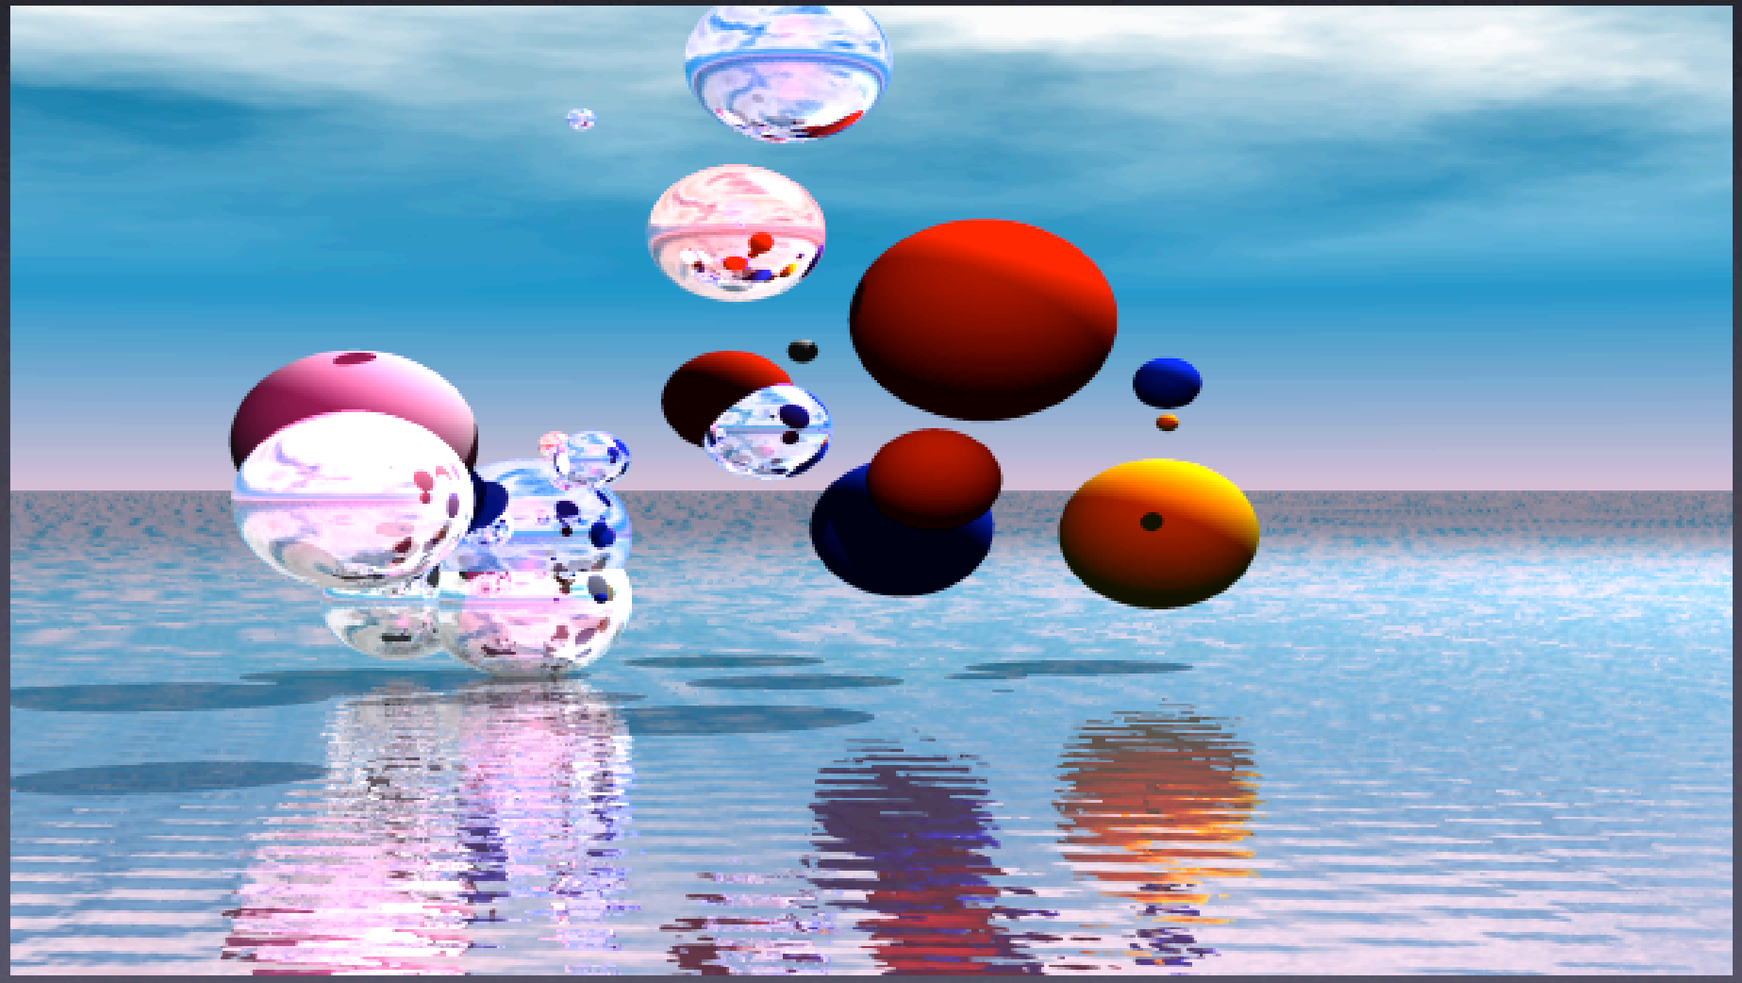
Starting string: "NA4 Generic Applications"

- *Audification* (melodisation): we associate a musical note to each letter of the text message:



“NA4 Generic Appl.” visualization

- *3D Visualization* (Java program + POVRay)



Thank you!
