

- **Provide some resources which will enable new VOs to submit jobs to the grid while the dedicated resources that they bring with them are being registered and certified in the grid.**
- **The details of the requirement from NA4 are:**
 - 2-4 production sites
 - Each site providing a CE, 7-10 WN CPUs and storage
 - 1 or more RBs (across all 2-4 sites, not one RB at each site)
 - 1 MyProxy server (across all 2-4 sites, not one MyProxy server at each site)
- **When new VOs come along, the sites will be expected to reconfigure immediately so that the new VO can use the site's resources; i.e. the sites cannot wait until the next release of middleware before they configure the new VO on their site.**
- **The resource requirement from each of the new VOs is expected to be very low as they will simply be learning how to adapt and use their software on the grid infrastructure.**
